If he was to pop up now and again with a reminder that he's alive things would be OK, but he posts a few K's of repeated dribble everytime and invites email responses, this is against the mood of this echo and is a misuse of same.

Fact is its a commercial enterprise and this is a non-commercial base. Join his mailing list if you want but I don't..

Count me in agreement too, resorting to insulting an atari dealer in an atari base is dispicable, it certainly shows who the asshole really is!

Hi Steve,

Thank you for doing the first archive of the CFN Atari SIG.

The archive you did was complete, as far as I could see (and when it was up),
up to a date before I finished cleaning things up on the SIG.

This new archive we've developed is complete, including the final housekeeping
I did on the SIG before the system went away.

I agree with Christopher, I think too it's ok that Bravo Sierra posts here.
Bravo Sierra has great items (especially for the 8-bit Atari), the prices are
fair and he's a friendly and trustworthy dealer. I have ordered from Ben before,
it was an overseas deal without any problems, and I am sure I will order again
some day.

First, I don't have the ROM, but I think this is a great idea.

Its a shame that the design for the later Ataris (XL.XEs) changed from the concept of the 800s. The 800s processor is on a plug in board and would make this link of upgrade easier. You would still be stuck with the 8-bit bus/addressing, but with the 816, at least you could use 16 bit indexing, and keep the 8 bit bus, and STILL reduce program space/size by 10 to 20% at least.

Tony

I think just about all CBM monitors are good, like the 1802 and the 1034<?>.
The other one you want to keep an eye out for is the Magnavox Color 80. The
Manavox color 40 is ok, but not in the same league with the 80.

It's just a throw back to the 80s. Believe it or not, there used to be no commercial posting to the newsgroups w/o having your account/access denied. This was back when it used to run from a lot of educational institutions.

In order to provide the commercial a place, the .biz hierarchy was created. Naturally the businesses refused to post there because no one used them, buy a clue kind of thing.<grin>

But these days, everyone has given up. I think it was former VP Al Gore who championed the commercialization of the internet through some of the funding changes he made while in congress and money is no longer a dirty word. That is the reasons for commecial posts were illegal as the internet was run from universities and government funded kind of thing. Times changed.

Well, not quite everyone as we saw here. I have.

I just finished the book about a month ago. I was disappointed, but
only because i was expecting more hardware and software details or
something. It focuses on the business side of things (hence the title
Rise and Fall). The author gets side tracked a few times. It
contains some intresting info, but not enough.

Just my opinion.

IIRC, it not only attaches to the Atari, but has switchable inputs so you
can use it as a CGA/EGA<320X200 16 color mode> monitor. I think it may have
had inputs for others, but not posititive. Very crisp display.

Calagan,

Rise and Fall is a very good one to read to get a overview of the pre-Tramiel days of Atari (Warner days). It was written quite some time ago. And the rights to republish have been given within the past year.

Another good one that has a very intersting chapter on Atari (the book is about Nintendo and their NES days) is Game Over by David Sheff (How Nintendo Conquered the World). This one has a chapter about the time Nintendo approach Atari about marketing the Famicon (in the US it is know as the Nintendo NES) system since Atari had the reputable household name of the day (back when children would drool to play Atari and not Sega, Nintendo or Playstation). Published by Vintage. ISBN 0-679-73622-0.

Also Leonard Herman's book Phoenix is a must get. Phoenix: The Fall & Rise of Videogames (Second Edition). ISBN 0-9643848-2-5. Published by Rolenta Press (they have a web page; don't have the address handy).

Stay away from the books written by J.C. Hertz (or a spelling close to that). She steals work from good authors. She doesn't deserve the book royality.

And one last one that I've found that has a reference to Atari (in the last chapter of the book) is The Home Computer Wars by Michael S. Tomczyk (An Insider's Account of Commodore and Jack Tramiel). Gives some insight as to his way of thinking in business and how he perceived advertising. Last chapter talks about his transition to Atari. ISBN # 0-942386-78-7. Published by Compute Books.

And for a very good video based triology, check out the videos by Howard Scott Warshaw (Once Upon Atari...). Howard was part of the 2600 game developers. He wrote three famous games: E.T., Raiders of the Lost Ark, and Yar's Revenge. You can find info on it at http://scottw.com/ouatari.html. I find this the best video series on Atari. It was written and produced by a person who acutally experience what it was like at Atari. Plus you get to see the faces of the people who worked at Atari and wrote a lot of the famous 2600 games. You get an understanding of the agony the went through in programming the 2600 and dealing with the Warner management when it came to recognition. The tape series is well worth the investment!

And if you have a Dreamcast or PC, get the Atari Anniversay game. There's video clip footage of interviews with Nolan Bushnell that are quite interesting to listen to. Over 37 minutes of video are in the game along with scans of rare arcade collectable stuff.

Just sharing some of the things I've read or viewed over the years that
relate to Atari.

Enjoy,
Glenn Bruner

Anyone know a atari 8bit software artchive?

With software images games, utilities, etc?

I want to build up a collection for myself - feel free to mail me at:
cjh3@hotmail.com for confidentiality.

Dan.

6325. Super Cart for Sparta DOS

Newsgroup: comp.sys.atari.8bit

Hi,

No it will not work SpartaDOS X does use a different style of switching and
can also be eanabled/disabled from software and also support pass-thru.

First, I don't have the ROM, but I think this is a great idea.

Its a shame that the design for the later Ataris (XL.XEs) changed from the concept of the 800s. The 800s processor is on a plug in board and would make this link of upgrade easier. You would still be stuck with the 8-bit bus/addressing, but with the 816, at least you could use 16 bit indexing, and keep the 8 bit bus, and STILL reduce program space/size by 10 to 20% at least.

Tony

> This was back when it used to run from a lot of educational institutions.

Well, things have changed since before I got on the interNet. My first
host was a commercial provider, and anymore, all my e-mail
correspondents log in through commercial providers. Also, all the web
sites I hit are run by or have space provided by a commercial enterprise.

And there are not as many people from back in the 80's still running
things as there was. And I am sure the attitudes of those from the 80's
still running any parts of the interNet have evolved along with the
interNet to where commercialization is not frowned upon like it was.

The only points where I see the old standards still in force are the
moderated newsgroups who have properly selected moderators who handle
their moderation assignments properly (only group I can site is
rec.food.recipes).

I should also point out that I have been following this thread though
rec.games.video.marketplace, a group that is decidedly commercial in
nature.

I really enjoyed "Joystick Nation" by J.C. Herz (note the spelling.) She
tries too hard to impress us with bug words, but it's a fun read.

The following is just my opinion, please feel free to simply skip this post if you wish.

This is for those people who are complaining about any commercial posts in the newsgroup.

Here are some points to consider:

1. Everyone here is interested a computer brand that no longer manufactures a computer. In fact, the company no longer exists.

2. The last new computer introduced by the company was in 1993.

3. What new computers that are available, such as the Hades and the Milan, are just updated versions of old technology and an old operating system. Magic, MiNT, Linux, will not keep this platform alive. You need a genuine manufacturer with a solid financial base that can afford an advertising budget to do that. Even then, you may be in a very niche market, Sun Microsystems comes to mind when talking about a niche market.

4. There is no dealer base that exists, at least in the United States, anymore.

Whether or not you like Bravo Sierra Computers or any other dealer, you ought to be thankful that someone is trying to fulfill a need for this platform, that need being a source of hardware and software rather than complaining about commercial posts in this newsgroup.

Some of the comments I've read in this thread and others are, IMO, absolutely childish. I used to be very proud of Atari owners, but these days I'm ashamed of them. This newsgroup has become the de facto source of Atari information and support today. Even though I firmly believe there is still a place for a simpler computer like the Atari, I do not recommend the platform to anyone anymore because of the way people behave in this newsgroup.

There are a number of individuals in this newsgroup who should look at themselves in a mirror, and ask themselves if their actions present a positive or negative impression of the very few Atari users left.

Well said, Ken.

There will always be complainers. There will also always be contributors. Of course, there will also always be newbies with little experience but lots of enthusiasm. Contributors encourage newbies. Complainers drive them away. The survival of this community will not only depend on veterans staying, but on newbies staying.

There is no vendetta and its not a personal issue, and its as relevant to
this base as are commercial advertisements in this non-commercial base.

Thanks Michael, thats the answer I was hoping for as I just won one on ebay.
I got burned on Demon Attacks that only runs on a 400/800 a couple of weeks
ago.
Are there a lot of carts like that or is Demon Attacks the exception?

Mark.

If it wasn't for the multi page dribble he posts each time, imposing himself on my phonebill, then I wouldn't mind so much. Other people can do it with a 4 liner, "Visit my Website at" will do no harm, and get him in the public eye, and I wont have to pay for it. Some people seem to forget that in GB we pay by the second for our IP.

I can think of a couple Gorf and Escape from Epyiz<sp?>. Cart compatibility
is pretty good, I would guess better then 95% of them will run on a XL/XE.

Steve,

Your hole reasoning and tone in this thread is an insult. Ben isn't "using" anyone. He's an atari user, who runs an atari related business. You have NO right to attempt to blacklist him from posting the occasional message. He isn't posting hundreds of messages. He isn't posting anything thats not atari related. Your inept arguments have no basis in reality. END OF STORY!!!!

btw, I haven't seen you complaining about the numerous ebay ads popping up in the atari newsgroups or the regular wanted / for sale ads from others. Its got me wondering just what kind of grudge you've got against Ben. Frankly I'd have no trouble to buy anything from him and I plan to do so where as seeing your own character I certainly wouldn't trust you in any matter where money was changing hands.

Hey Alan,

thats a very good point, And having a few good dealers and developers around like Ben Smith, Rogher Burrows, Nima Montaser, Uwe siemet, Brad Koda and many others I haven't mentioned help keep us atari users going too.

Look at
http://www.atarihomesoft.f2s.com
There you will find a lot of games and demos for the 8bit ATARI.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

->
->This newsgroup has become the de facto source of Atari information
->and support today.

I agree with that. This has been the case for many years now,
particularly with regard to 8-bits.

->Even though I firmly believe there is still a place for a simpler
->computer like the Atari, ...

I'd like to agree with that!! Ahh, if it were only so!!

->... I do not recommend the platform to anyone anymore because of
->the way people behave in this newsgroup.

But here I disagree. Your negative reaction is way too strong.
For several years I've been reading almost every Usenet newsgroup
that I follow on a strictly selective basis. On most newsgroups I
decide which postings to read based on subject header. On certain
newsgroups I use a different formula, based on the identity of the
poster. Either way, I'm selective. For one thing, I avoid flame
wars. If I know that a certain poster never has anything valuable
to contribute (and if you follow many other newsgroups, you'll
understand what I mean!), or if I see that a certain thread has
drifted from the original topic or has drifted into useless dis-
cussion or flaming, then I simply don't bother to read those post-
ings. You could do the same thing. There's no need for you to
dismiss the value of the entire newsgroup (and thence the entire
Atari platform?!?) just because of a few bad apples among the
posters or a few postings that you don't like or agree with.

Note: Because I'm strictly an 8-bitter and don't look at those
other newsgroups, I've deleted the crosspostings; and because of
thread drift I've changed the subject title.

Howdy folks

Last week I managed to get Outlook Express to show me all the messages of all the threats in a newsgroup and also show me more then 300 messages at a time. Today I can not seem to be able to do so. I'm using a computer from a computer pool at the university and unfortunately, all the configuration stuff (and old messages) are saved to teh local harddrive. Meaning that if I get a different computer each time (which is highly likely), my configuration will be different every time and my old messages will be spread over a bunch of computers. Please help. (yes, I am getting desperate.)

Hello James,

Thanks for the kind words.

You won't see me here frequently. I've been doing my 8-bitting in emulation for the past several years because of my expanding interests in using PCs to help people with disabilities, in music, and a bunch of other things. But I feel that nothing can disrupt a newsgroup and the community it represents more than the kinds of stuff we've been seeing in the past few days. I see it in other newsgroups. It comes and goes, and the newsgroup survives, but a lot of people are driven away.

But it's more serious in a group like csa8. Can the Atari 8-bit community afford to alienate people at this time? I don't care if they're newbies or very experienced people, vendors, developers, programmers, sysops, guys discovering Atari 8-bits for the first time, or people like me.

I have no Atari hardware at this point. The only software I have is a collection of .ATR files and the like. It wouldn't take much to get me to drop that, too, and the events of the past week had me thinking about it. But I've been involved with Atari 8-bit computers since 1983. I've made friends in user groups, on BBSs, and in this newsgroup. I learned how computers should work and about all the wonderful things they can do by using Ataris. That can't be done without a feeling of community.

Ben wrote to me to thank me for support, although I never bought, nor will I probably ever buy anything from Bravo Sierra. I guess it has more to do with shared interests, good manners and ethical behavior than dollars.

It's a story with a simple moral: If somebody has a complaint with a vendor, tell the vendor. Newsgroups are PUBLIC!

Take care.

Alan

Howdy folks

Roland Scholz is looking for somebody who's willing to help him finish his PC-Bridge software. PC-Bridge is a piece of hardware that is fully PBI compatible and enables you to connect PC cards (ISA/8 bit, but he said something about 16 bit's would be possible) to your ATARI 8 bit. Contact him via roland.scholz@gerling.de (tell him I sent you, so he knows who's to blame.)

Talking about PC's:

Anybody ever come up with a way to have the BlackBox read and write PC disks. (I wanna use a standard atari 8 bit sector editor to check out PC disks and maybe even fix them)

i have 3 of those maganvox rgb 80s and i love them. 2 of them are my spares
in case something happens to my others. it was pretty funny about a year
ago, i got my first rgb80 magnavox and bought it home. when i got it home,
the danged thing was dead (a 1 dollar speical at the thrift).

i then bought it to my local computer montior repair person. he is an older
but very friendly guy who has done tv repair for the last 30 years and the
last few years changed his business into a monitor repair place. he laughed
when i had him repair this old composite 12 inch monitor. costs me 20 bux
to get fixed and i was thrilled..

now i have 3 rgb 80s, a 1702, and a couple apple 2e color composite monitors
and a couple green screen composites.. :)

I could be wrong on the model, but there was definately a monitor out that
did multiple modes. Had about 3 connectors in the back, 9 pin IBM style for
mono or CGA/EGA, composite, maybe one or two others like TRS or Apple.

The RIP format also seems to be used in the ST/TT scene as one or another graphic format. This explains why you get that much hits :-)

I have a PC-util laying around to make Atari RIP pics out of BMP pictures. You need to resize the picture and save it twice to you PC disk. One as 9-color pic (Paintshop for example can do this) and the other one as a greyscale pic. It's basically the same as HIP, which also combines 2 pictures to 1 display, but with RIP one of pics is a colorized one.

Received over here.

: For others: You can downoload from: www.atari8.prv.pl/stuff/sparta.zip

: !!! It's all asm code with POLISH informations. !!!

Hmm. In many cases I wished I had learned Polish. Would be very handy on
some copy-parties and with source-codes, not to mention the games :-))

I'm with Eric on being disappointed. I wanted more on the 400/800 and found
it seemed to focus more on the 2600 and the financial side of the business.

I think it is a 1084; and there is an "S" stereo version which will not
matter without the pokey upgrade.

I have the Magnivox RGB 80 monitor hooked up to a 130XE via an Atari
monitor cable. The red lead is plugged into the composite RCA input
and gives a great picture. However the black lead plugged into the
audio input gives only static. How to get the audio correct ? tks

Slap 'em back up as they would have been purged by Clara.

I'll let you know if they arrive..

6377. onderdeeltje voor Whirlpool magnetron

Newsgroup: comp.sys.atari.8bit
Date: 2001-10-30 12:02:14 UTC
From: Mathy van Nisselroy <nisse-ma@reze-1.rz.rwth-aachen.de>
Message-ID: <9rm4sa$el5$1@nets3.rz.RWTH-Aachen.DE>
Source record: 33301

Hallo luitjes

Onze magnetron AVM930 van Whirlpool heeft een nieuw onderdeeltje nodig. Ik ben hiervoor bij Handyman geweest, maar die hebben het verkeerde onderdeel in hun computer gevonden. Hoe kan ik nu aan het juiste onderdeel komen.

Boven in de (combi) magnetron zit een grill element. Onder dat grillelement loopt een 'ijzer draad' van voor tot achter. (deze zit er onlosmakelijk mee verbonden) Om te zorgen dat er geen vonken overslaan tussen deze draad en de binnenkant van de magnetron zitten er op beide eindjes dopjes. Ik neem aan van keramiek. En nu is een van die dopjes kapot gegaan. Dus hebben we een nieuwe nodig. Hoe kom ik aan zo'n dingetje. Ik heb al op het net gezocht, maar zonder resultaat.

Het dopje ziet er eigenlijk een beetje uit als een mok, maar dan zonder oortje en op 'playmobil' formaat. (een busje/cilinder met een blind gat, diameter en lengte allebei nog geen centimeter schat ik)

I don't mind occasional ads, I do mind people imposing multi-page ads on me that I have no choice but to pay for. Others can advertise with a simple one sentence with a link in, others should be able to adapt.

It'd be good if you were a little more specific what you're looking for.
There are whole technical reference books, like 'Mapping the Atari',
available on the net. Don't know if could view it with DOS viewer.
I mean, you could maybe save it and unhtmlize it (I have a program
to unhtmlize.) For a very brief intro to assembler, I have a could
text files on my site. One ATASCII and one ASCII I think.
There's also ATAS2ASC and ASC2ATAS for converting there.
It's in the assembler info area, about 1/2 way down the opening page.
http://www.en.com/users/russg.
You almost sound like you're using a non-browser type connection,
like lynx.

Its 'Dribble' here, a local thing I think, as for the gradeschool level, I thought that is what I was on.

Does the "ahole" in your email address stand for Arsehole??.

6392. R: Handler Questions

Newsgroup: comp.sys.atari.8bit
Date: 2001-10-31 03:35:30 UTC
From: Ken Siders <atari8bitREMOVE@columbus.rr.com>
Message-ID: <6kKD7.9045$_Q6.3161348@typhoon.columbus.rr.com>
Source record: 33315

I have found a few sources of the various XIO functions used with an R:
devices but a couple
things I have never seen explained.

If you do a GET and no characters are available, does it
(1) Block until there is something to get? (don't think so)
(2) Returns immediately with Null? (or other value?)
(3) Returns immediately with some error status? (error code # would be??)

And for a PUT, if the output buffer is full...
(1) Does it block until some buffer space is freed up?
(2) Return an error status code?

Or if someone has some really detailed documentation.

Thanks,
Ken Siders
http://home.columbus.rr.com/ksiders/atari.htm

I don't know what everyone else does or how it is supposed to be done.

How I do it: I always issue a status command to the handler first. If the
status shows a byte is available, I think do the GET byte routine. If there
is nothing there, I don't go to the GET routine.

I'm now wondering, is this interNet newsgroup gating through somewhere as a Fido echo also? If so, that would explain the disagreeing perspectives on rules. Fido Net does still maintain strict rules that are enforcable, whereas interNet newsgroups rules and guidelines are not only virtually unenforcable, but are much more liberal and anymore subject to evolutionary change.

If there is a bridge into Fido Net, said bridge needs to be severed, as the two are not supposed to be mutually exchangable.

6401. new Atari 8-bit web page monitoring service

Newsgroup: comp.sys.atari.8bit
Date: 2001-10-31 12:22:05 UTC
From: NoOne@FakeEmail.com
Message-ID: <914B47502CTHEnterprises@205.212.123.11>
Source record: 33324

I've set up a service that watches Atari 8-bit web pages for changes in content. It checks on them once a week and produces a web page that has a status icon beside each link. If a web page has had new content added or altered an "updated" icon will appear beside it. If it is a new link then "new" will appear beside it. If it is currently offline then a circle with a slash will be beside it. If it is online but it's content hasn't changed then a check mark will appear beside it. The service is called HotLinks. By using it you can quickly see which sites have had new content added to them. The URL is- http://cth.dtdns.net/HotLinks/hotlinksEnglish.html

If the service goes as well as I want then I will expand upon it and add the other Atari 8-bit language sites in my link-farm to it as well.

Then don't read the freakin' newsgroup, dummy. if you are so concerned. exactly how much is it per second for internet access? a penny? if so add up the amount of penny's as to how many of ben's posts there are over the period of a year. i bet its like 50 or 60 cents or something like that (over a years time). If you are so darned concerned about that kind of money, you shouldn't be able to afford a computer much less internet access.

if i am totally wrong (if its like a dollar per second or somethingg like that) i will take what i said back.

if you are so concerned about the small change cost for one of bens posts and you are upset over it because of the "principle" then thats just silly. i think you have "wasted" more money with this debate than you ever would just ignoring ben's posts.

like others have said, just DON'T download the messages when you scan the headers!!!

Ben,

From what I can find on the web, the Magnivox RGB 80 is like either
the 1902 or the 1084.

Since you have the 1902, which Atari 8 bit do you hook the monitor to
? (If you use it for the purpose). Do you use a monitor cable from
the ATari to the Commodore monitor and if so, which leads do you use
to attach to the monitor ? Thanks.

Ron

It seems that rules dont count if the relevant anus has done you a favour
sometime in the distant past.
I should join ALT.PARKING.TICKETS, or ALT.GET.OUT.OF.JAIL.FREE and hopw
double standars operate in there.

> If there is a bridge into Fido Net, said bridge needs to be severed, as
the two are not supposed to be mutually >exchangable.

Good old fidonet, now what was my node no. 2.254.102.9 ???

At least, not properly for me either! It clears the window and starts another image before the previous one was completely loaded and it is much too quick.

maybe if we used 8bit ataris which would then be slow enough to properly
view this page, we wouldn't have any problems. LOL

Can't some browsers do this? I seem to remember Netscape (from long, long ago... and under Win95, which I don't use) having some kind of "has this bookmarked page been updated since I last saw it?" feature.

see below a bit.

> Hence your lax attitude to this echo.

This is a usenet newsgroup, neither a 'base' nor a fidonet echo.

> > This newsgroup has become the de facto source of Atari information and
> support today.
>
> Non-commercial of course.

No such rule exists for this newgroup, cf. below.

> You pratt!!. you'd better tell people to stop buying Ford Fiesta's and
> Vauxhall Nova's coz of the way they are driven by 'Some People'. Dillweed!!.

Childish comment, cf. above.

> Could you take the time to explain what a 'rule' is and its purpose please.
> Or are you the sort of idiot who turns a blind eye to what suits them.

From the faq, at:
http://www.faqs.org/faqs/atari-8-bit/welcome/
...
There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the
custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups
instead.
...

So, no charter, no moderator, and no binaries. Searching the faq for 'commercial' or 'business' gets no hits. Looks like Bravo Sierra _is_ following the rules.

Here is another world of Atari 800 and 800XL...

Archive-name: atari-8-bit/welcome
Posting-Frequency: 7 days
Last-modified: August 7, 2001

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the
custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups
instead.

I seriously hope you're not planning on selling these files you are downloading! I noticed you've posted the same question in several newsgroups that I frequent. I've also noted the fact that I've never seen you post in any of these groups before. These FTP sites are for the benefit of the 8bit computer hobbyist, not to benefit your pocket. Most of these programs are still copyrighted and the authors frequent these newsgroups as well as the popular auction sites. I'd be very careful whatever your intentions are.
Mo

Mo,
I have no intentions of selling the CD's either to recoup my losses on blank cd's or postage or even to make a profit. My idea is to archive as much eight bit software as possible before they really do die off.
Jeff

Hiya,

I certainly hope the files will still be usable on a real 8bit (of which I have 2) and not emulators only. If so then I'd be interested

This has been done before. Several times, actually. I did it myself a
few years back, but I made the mistake of charging for it. It paid for
my first CD recorder, but I got a lot of complaints from people whose
work appeared on it.

I now have parts of it (rotated periodically) at my web site at
http://www.holyoak.com/atari

- Trevor

Source record: 33362

Aside from differences in the video hardware the power supplies will be
different, in differing parts of the world (ie europe in this example)
different powrer plugs (on the wall) are used and often the operationg voltages
are in the 220 to 240 volt range insetead of 110 to 120 used in north america

True on both levels.

You are right that you shouldn't have to put forward the effort to killfile
someone who is using bandwidth in a manner you find objectionable.

You are right that it is easy for me to killfile you with a click or two in
OE as you have contributed more to off topic and cross posting, taking more
bandwidth, then Ben has in the last year.

Thanks for reminding me or both items. I would suggest you follow your own
pet criteria and don't force more people to do an extra click or two to
killfile you if you are sincere in your beliefs.

6441. 8-bit software on a vinyl record?

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-01 22:40:33 UTC

I found this while surfing the other day. For all I know it is a joke, but then I have no idea. It says-

" The 8-Bit Construction Set record is also the first ever use of the vinyl recording medium for software distribution "

and

" "What Joe Satriani is on guitar, The 8-Bit Construction Set are on Atari! "

Here's the links-

Some people don't like giving out their email addresses. This way
it's a bit more anonymous. One click and you can see what's new this week
without cluttering up your inbox.

Some people might not feel comfortable with allowing a browser handling this unattended at night, privacy issues and all that. Then there's bandwidth issues. Compare 1000 users all checking the same pages as compared to a single user. I'm a big fan of conserving bandwidth on the net. I even use a lynx browser on my PC. With lynx you get pure content without the hype.

The Stranglers released a text adventure alongside their 'Aural sculpture'
LP. If i remember right it was avalible on a 33rpm single.
the adventure if i remember was a Quill program.

Well you brought the cost aspects up, that is why I mentioned this.
Well if you're happy with downloading the whole thing, that's ok with
me.

About killfile, I tend to agree. But then, should I have to add you to
my killfile, in order to avoid seeing posts where you call ppl
different kinds of names?

I should not have to do that, should I?

Regards,

Jokaim

6446. Bravo Sierra Gives Thanks! Customer Appreciation Month!

This reminds me of the time I was subscribed to the newsgroup for PIC (microchip) microcontrollers. A guy got on and said he was a business owner who had a contractor who got all pissed off one day,left, and took the source code with him. The only thing the guy had was a chip that was programmed, but copy protected. The poster was wondering if there was any way to clear the protection bit, to read the code back out of the thing...

MY PROBLEM, was that I actually gave the guy the benefit of the doubt and answered him truthfully that there was little he could do....

THEN, and here's the BEST part.... a group of like 2 or 3 guys tore this guy a new asshole and then proceeded to tear into ME, because I was saying to the group that 'this guy posting could be telling the truth'. This attack went on over 3 or 4 days..... good grief.

The end result? Well, I make a living programming PIC microcontrollers, but I will NEVER go back there again. I have also been asked by other guys using PICs if there was a place on-line and I've told them the truth,'you can try this group, but ......'

And once again the abuse. Ken makes a valid comment and is called an
idiot.

You really are a foul mouthed, ignorant, self opinionated, tight fisted git.
Where you the class room bully aswell ?

You complain enough about others so I think others should start complaining
about you. Just face it, most people don't mind small businesses posting
but do mind your language and abuse. Either grow up or go away.

Back in the 70's, there was a BASIC for the Motorola 6800 processor
that was released on a phonograph record. IIRC, you used the turn
table like a read-only cassette recorder.

Timeline
11.1) How did Atari get it's name?
11.2) What is the History of Atari?

Subject: 1.1) What is an Atari 8-bit computer?

Based in Silicon Valley in the U.S.A., the company known as Atari produced a line of home computers from 1979 to 1992 often referred to collectively as the "Atari 8-bits," the "8-bit Ataris," the "400/800/XL/XE series," etc.

The computers included the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

These machines competed in the marketplace with the likes of the Commodore 64 series, the Apple II series, the Texas Instruments TI99/4A, and the Radio Shack Color Computer. Of these, the 8-bit Atari is most similar to the Commodore 64.

The 8-bit Atari computers are not software compatible with other Atari platforms, such as the 2600 Video Computer System (VCS), the 5200 SuperSystem, the 7800 ProSystem, or the ST/TT/Falcon computers. All of these but the 5200, however, do share the same joystick/controller hardware port.

Here are some of the performance specifications of the 8-bit Atari:

(Some of the rest of this section by Bill Kendrick)

CPU: 6502 (MOS Technology)
CPU CLOCK SPEED:
NTSC machines: 1.7897725 MHz
PAL machines: 1.773447 MHz

SCREEN REFRESH RATE:
59.94 times per second (Hz) on NTSC Ataris
49.86 Hz on PAL machines

GRAPHICS MODES:
ANTIC CIO/BASIC Display Resolution Number of
Mode # Graphics # Type (full screen) Colors
---
2 0 Char 40 x 24 1 *
3 - Char 40 x 19 1 *
4 12 ++ Char 40 x 24 5
5 13 ++ Char 40 x 12 5
6 1 Char 20 x 24 5
7 2 Char 20 x 12 5
8 3 Map 40 x 24 4
9 4 Map 80 x 48 2
A 5 Map 80 x 48 4
B 6 Map 160 x 96 2
C 14 ++ Map 160 x 192 2
D 7 Map 160 x 96 4
E 15 ++ Map 160 x 192 4

F 8 Map 320 x 192 1 *
F 9 + Map 80 x 192 1 **
F 10 + Map 80 x 192 9
F 11 + Map 80 x 192 16 ***
* 1 Hue; 2 Luminances
** 1 Hue; 16 Luminances
*** 16 Hues; 1 Luminance
+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.

GRAPHICS INDIRECTION (COLOR REGISTERS AND CHARACTER SETS):
Nine color registers are available. Each color register holds any of 16 luminances x 16 hues = 256 colors. (Four registers are for player-missile graphics.

Character sets of 128 8x8 characters, each with a normal and an inverse video incarnation, are totally redefinable.

PLAYER-MISSILE GRAPHICS: (byte height and OR corrections from Piotr Fusik)
Four 8-bit wide, 120 or 240 byte high single color players, and four 2-bit wide, 120 or 240 byte high single color missiles are available. A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to OR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

DISPLAY LIST INTERRUPTS (DLI's):
Screen modes can be mixed (by lines) down the screen using the Display List - a program which is executed by the ANTIC graphics chip every screen refresh:

All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via DLI's.

SCROLLING:
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.

SOUND:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.

A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.

Subject: 1.2) What is the Atari 400?

Released along with the 800 in 1979, the 400 was the low-end model of the two. The only 8-bit Atari with a membrane keyboard rather than a full-stroke keyboard. One of the few 8-bit Ataris lacking a composite monitor port. Originally released with just 8K RAM, but most were sold with 16K RAM. There was also a factory-authorized 48K upgrade available through dealers.

Only the 400 and 800 8-bit Atari models have four controller (joystick) ports.

Early 400 units include the CTIA chip; later units include the GTIA chip, also present in all later 8-bit Ataris.

The 1982 Atari catalog calls the 400 "The Basic Computer".

The 400 was discontinued in 1983.

During development the 400 was known internally as "Candy."

Subject: 1.3) What is the Atari 800?

Released along with the 400 in 1979, the 800 was the high-end model of the two. The 800 is the only 8-bit Atari with a Right Cartridge slot, in addition to the Left Cartridge slot as present on all 8-bit Ataris. Originally released with just 8K RAM, many were sold with 16K, later on 48K was standard.

The 800 is also the only 8-bit Atari with a four-slot modular design, where the first slot holds the CX801 (CX801-P for PAL machines) 10K ROM module, and the other three slots hold combinations of CX852 8K or CX853 16K RAM modules.

Only the 400 and 800 8-bit Atari models have four controller (joystick) ports.

Early 800 units include the CTIA chip; later units include the GTIA chip, also present in all later 8-bit Ataris.

The 800 was discontinued in 1983.

During development the 800 was known internally as "Colleen."

Subject: 1.4) What is the Atari 1200XL?

Released as a big brother to the 400/800 in 1982, the 1200XL now uses Atari's slightly customized 6502C microprocessor, and includes a full 64K RAM. The 1200XL was the first 8-bit Atari with just 2 controller ports. In addition, the 1200XL includes 4 programmable Function keys and a Help key, 4 LEDs, built-in diagnostic and graphics demonstration programs, and probably the favorite keyboard of any 8-bit Atari computer. Clicks previously outputted through the built-in speaker are now heard from the television or monitor's speaker. The revised 16K Operating System offers many new features, including an alternate International Character Set.

The 1200XL was the biggest single step forward in development of the 8-bit Atari platform, but the corresponding software compatability problems hurt its popularity.

The 1200XL lacks separate chroma video signal, and also lacks the +5 Volts power on pin 10 of the SIO port.

The 1200XL was discontinued in 1983.

Subject: 1.5) What is the Atari 600XL?

Released in 1983 as a replacement for the 400, the 600XL is the low-end version of the 800XL. The 600XL/800XL include most of the features of the 1200XL minus the Function keys and the demo program. But both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Bus Interface (PBI), providing fast parallel access to the heart of the computer. The 600XL has 16K RAM.

The 600XL can be expanded from 16K to 64K with the Atari 1064 Memory Module.

Normally boots with Atari BASIC (Revision B) enabled;
Hold down [Option] on startup to boot without BASIC.

The North American/NTSC 600XL does not include a composite monitor port;
The European/PAL 600XL includes the monitor port, but this lacks the chroma video signal.

The 600XL was discontinued in 1985.

Subject: 1.6) What is the Atari 800XL?

Released in 1983 as a replacement for the 800 and 1200XL, the 800XL is the high-end version of the 600XL. The 600XL/800XL include most of the features of the 1200XL minus the Function keys and the demo program. But both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Bus Interface (PBI), providing fast parallel access to the heart of the computer. The 800XL contains 64K RAM.

Normally boots with Atari BASIC (Revision B) enabled;
Hold down [Option] on startup to boot without BASIC.

The 800XL lacks separate chroma video signal.

There was a late version of the 800XL in Europe, called 800XLF. The 800XLF includes a redesigned motherboard (a la the XE computers) and contains FREDDIE for memory management and has chroma output. BASIC is Revision C.

Though Atari never disclosed sales figures, the 800XL was likely the most-sold of all 8-bit Atari computer models.

The 800XL was discontinued in 1985.

Subject: 1.7) What is the Atari 65XE?

Released in 1985 as a replacement for the 600XL, the 65XE is the low-end version of the 130XE. The 65XE is nearly identical to the 800XL in features, minus the PBI. European 65XE's include the ECI port, present only on the 130XE in North America. All XE computers also include the FREDDIE memory management chip.

Normally boots with Atari BASIC (Revision C) enabled;
Hold down [Option] on startup to boot without BASIC.

The 65XE was discontinued in 1992.

Subject: 1.8) What is the Atari 130XE?

Released in 1985 as a replacement for the 800XL, the 130XE is the high-end version of the 65XE. The 130XE offers 128K RAM, plus the FREDDIE memory management chip, supporting the unique (but rarely used) ability for the 6502 and the ANTIC to independently access RAM banks. In addition, the 130XE replaces the PBI port with the Enhanced Cartridge Interface (ECI), continuing the powerful feature of a fast parallel port.

Normally boots with Atari BASIC (Revision C) enabled;
Hold down [Option] on startup to boot without BASIC.

The 130XE was discontinued in 1992.

Subject: 1.9) What is the Atari 800XE?

Unseen and unknown in North America, the 800XE was sold in eastern Europe. The 800XE is identical in features to the European version of the 65XE (which was sold in western Europe). The 800XE could also be described as a 64K version of the 130XE.

Normally boots with Atari BASIC (Revision C) enabled;
Hold down [Option] on startup to boot without BASIC.

Jindrich Kubec writes, "The problematic Chinese 800XEs with GTIA problems were manufactured in 1992."

The 800XE was discontinued in 1992.

Subject: 1.10) What is the Atari XE Game System?

In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system. It offers the convenience of a detachable keyboard and built-in Missile Command game (hold down Select at startup), while offering 64K RAM and full compatibility with the 65XE. It was packaged with the Light Gun, and the Flight Simulator II and Bug Hunt cartridges.

James Bradford offers:
With the keyboard connected and no cart, basic boots, with out a

keyboard connected and no cart, the built in game runs.
There is only 1 32K ROM in the XEGS, it has the OS, BASIC (Rev C) and
Missile Command on it.

The XE Game System was discontinued in 1992.

Subject: 1.11) What are the ANTIC, CTIA/GTIA, POKEY, and FREDDIE chips?

The following four paragraphs were written by Chris Crawford and appear in De
Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc.,
1981-1982. The text been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different
from other systems. It of course has a microprocessor (a 6502), RAM,
ROM, and a PIA. However, it also has three special-purpose (LSI) chips
known as ANTIC, GTIA, and POKEY. These chips were designed by Atari
engineers primarily to take much of the burden of housekeeping off of the
6502, thereby freeing the 6502 to concentrate on computations. While
they were at it, they designed a great deal of power into these chips.
Each of these chips is almost as big (in terms of silicon area) as a
6502, so the three of them together provide a tremendous amount of
power. Mastering the Atari 8-bit computers is primarily a matter of
mastering these three chips.

ANTIC ("Alpha-Numeric Television Interface Circuit") is a microprocessor
dedicated to the television display. It is a true microprocessor; it has an
instruction set, a program (called the display list), and data. The display
list and the display data are written into RAM by the 6502. ANTIC retrieves
this information from RAM using direct memory access (DMA). It processes the
higher level instructions in the display list and translates these instructions
into a real-time stream of simple instructions to GTIA.

CTIA ("Color Television Interface Adapter") / GTIA ("George's Television
Interface Adapter") is a television interface chip. ANTIC directly controls
most of GTIA's operations, but the 6502 can be programmed to intercede and
control some or all of GTIA's functions. GTIA converts the digital
commands from ANTIC (or the 6502) into the signal that goes to the
television. GTIA also adds some factors of its own, such as color
values, player-missile graphics, and collision detection.

POKEY (means "POT and KEY" as in the paddles and keyboard) is a digital
input/output (I/O) chip. It handles such disparate tasks as the serial I/O
bus, audio generation, keyboard scan, and random number generation. It also
digitizes the resistive paddle inputs and controls maskable interrupt (IRQ)
requests from peripherals.

All four of these LSI chips function simultaneously. Careful
separation of their functions in the design phase has minimized conflicts
between the chips. The only hardware level conflict between any two
chips in the system occurs when ANTIC needs to use the address and data
buses to fetch its display information. To do this, it halts the 6502

and takes control of the buses."

6502--MORE:
While the 400/800 models contain a generic 6502B CPU (a faster version of the original 6502A microprocessor), all of the XL/XE models contain Atari's customized 6502C chip.

On the Atari, there are two microprocessors, ANTIC and the 6502. To allow them to coexist, ANTIC must shut off the 6502, a process called DMA. The 6502B supports DMA, but in Atari's implementation, it required 4 chips. The 6502C has an extra line called HALT. It is controlled by ANTIC which uses it whenever it needs the data/address bus. The HALT line is on pin 35 of the Atari 6502C and must be pulled high for the chip to work.

FREDDIE:
The 65XE/130XE/800XE/XEGS contain a small additional LSI called FREDDIE, a RAM address multiplexer. According to James Bradford, "FREDDIE is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. FREDDIE also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a FREDDIE but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from FREDDIE, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to FREDDIE for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say FREDDIE does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO FREDDIE) and an extra 8 RAM chips."

And more recently James Bradford has written:
FREDDIE is just a memory decoder and timer. It replaces several chips in the 800xl The small chip near FREDDIE does all the bank selection.CO25953. One line from FREDDIE , Ras (or is it cas?) goes to this chip, Halt and the bank /processor select lines go into this same chip and ras (cas?) comes out. a pin for each bank. If i remember correctly, refresh also goes into this small chip. It would be quite easy to make an 800xl work just like a 130xe with this chip since Ras (Cas?) is required by ALL dynamic ram.

GTIA--MORE:
In BASIC, type POKE 623,64 [RETURN] and if the screen blackens, you have the GTIA chip. If it stays blue, you have the old CTIA chip.

By the way, apparently no CTIA-equipped Ataris were shipped to Europe.

Clay Halliwell provides this tidbit:
A bit of trivia: CTIA 400/800s artifacted in blue/green, GTIA 400/800s artifacted in green/blue, and all XL/XEs artifact in red/blue.

Jerry Jessop explains why French Ataris produce fewer colors:

"I will tell you why it only has monochrome out, because it's SECAM and a SECAM GTIA was never produced. The PAL GTIA is used in France and the Lum outputs are run into an onboard encoder to produce a "psudo" color depending on the Luminance output, composite only. This is why a SECAM VCS or 800 has nowhere near the same number of colors (16) availible as a PAL or NTSC unit (256).

> Jindrich Kubec interjects: (5/12/01)
> This is questionable. There's at least one SECAM computer with SECAM
> GTIA part no. C020120. On the other hand it's maybe prototype. (Curt
> Vendel has it on his site).

The FGTIA was never completed as the market size did not warrant the expense. The largest SECAM market is not France but the Soviet Union (former) and in 80-84 sales of these items there were not possible."

Andreas Magenheimer writes:
All of these newer and buggy GTIA`s were built with the "eastern european" XE computers. they were made in China. Although Atari knew about this, they did not change them. so you have to replace them with older XL/XE GTIA chips...

But one more thing to GTIA and ANTIC chips: All PAL versions of these chips have a color bug, since gr. 11 produces 16 colors, but merely 15 different colors (one color: brown at the beginning and end of the palette is absolutely the same; normally there should be a red tone here !); with gr. 9 you will see 16 shades, but merely 15 different shades (the same as gr. 11, one shade is doubled!).

Strange enough, I also found this color bug to appear in PAL ANTIC chips, there is also the red tone missing (and the brown one doubled !). This color bug appears in all PAL ANTIC and especially GTIA chips. Atari never fixed it, so you find it inside any GTIA equipped PAL Atari 800 and also the later XL and XE models. Since PAL users have to live with this bug, they sometimes do programs which look absolutely strange on NTSC and vice versa (not to mention the different Herz frame 50/60 hz and higher PAL line resolution/overscan).

Imagine the following: a PAL GTIA has 15 colors in gr. 11
a NTSC GTIA has 16 colors in gr. 11
a PAL GTIA has 15 shades in gr. 9
a NTSC GTIA has 16 shades in gr. 9

Thus, a combination of gr. 9 and 11 gives:
16x16 = 256 colors on NTSC
15x15 = 225 colors on PAL

And - as said before, the bug seems also to appear with ANTIC...
Bad luck, we PAL users... Greets - Andreas Magenheimer.

Jindrich Kubec provides another opinion: (5/12/01)
"ANTIC has nothing to do with colors. So it can't have any color bug.

The colors are generated in this way: color 0 is not a color. So it leaves us with 15 colors. Imagine it as a color circle. And each color is generated with some shift. (360 / 15 degrees). It seems that the value was selected incorrectly for PAL so that the first (color 1) and last (color 15) are same or almost same.

I haven't noticed any problems with shades in graphics 9.

Thomas Richter interjects: (5/12/01)
> I did, happens on my (PAL) 800XL in Gr.9. Grey shapes 7 and 8 are
> identically. I would guess the problem is a poorly adjusted D/A converter.

Jindrich:
> I should test this. But the luminance circuits should be same for PAL &
> NTSC.

Thomas:
> Other strange effects happen if you place a shape 7 pixel near a shape 8
> pixel, it looks like a faint vertical line of a slightly darker shape.
> Most likely a capicity/charge problem in the D/A converter (note that the
> output of every single bit gets reversed!)

Jindrich:
> Yes, I notified this many times.
>
> But there is nothing like adjustable D/A converter ;) There are four
> outputs of GTIA called LUM0-LUM3. They are amplified, run thru four
> different resistors (36k, 18k, 9k1, 4k7) and the lines are then
> connected together with CSYNC. The output goes to some analog circuit
> (amplifier?) and out goes the luminance signal.

Thomas:
> This *IS* the D/A converter. (-;

Jindrich:
> But it's not adjustable ;)

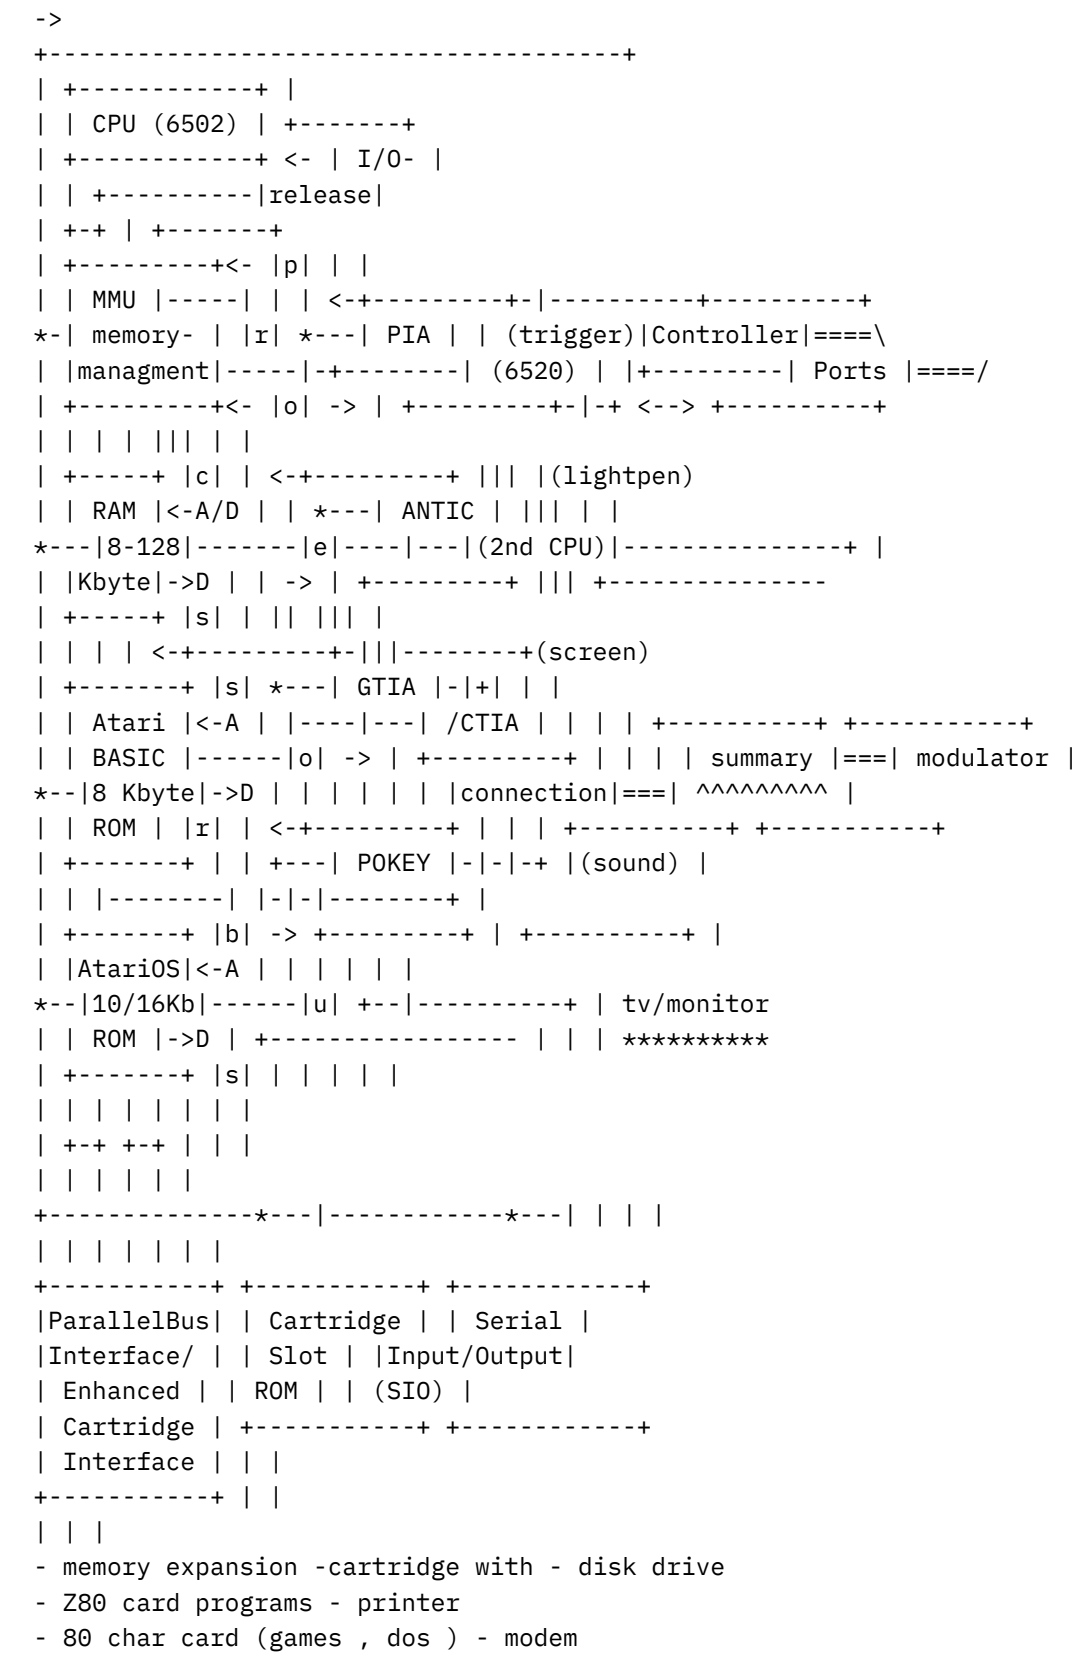
Greg Menke:
> Sure it is, just change the resistors- 10 turn pots with the center
> values more or less equivalent to the respective resistors would
> probably do it.

Jindrich Kubec adds:
"The other thing is real existing GTIA problem in latest revisions of China produced XEs, where GTIA modes have problem that 2 of 4 subpixels of pixel have invalid luminance."

Technical data and schematics for the ANTIC, GTIA, and POKEY chips are available on Curt Vendel's web site, thanks to permission from Hasbro's Atari Interactive Divisions release of this data. See:
http://www.atari-history.com/articles.html

Subject: 1.12) What is the internal layout of the 8-bit Atari?

ASCII art by Thomas Havemeister.



- memory expansion -cartridge with - disk drive
- Z80 card programs - printer
- 80 char card (games , dos) - modem

NOTES
* RAM: 400/800: 8K, 16K or 48K standard

600XL:16K standard
1200XL/800XL/65XE/800XE/XEGS: 64K standard
130XE:128K standard
* ROM: 400/800:10K OS, 1200XL:16K OS, all others:16K OS + 8K Atari BASIC
* CPU: 400/800:6502B, all others:6502C
* 800 includes two Cartridge Slots, all others include one
* early release 400/800 have CTIA instead of GTIA
* 400/800 have 4 Controller Ports, all others have 2
* PBI is on 600XL/800XL only
* ECI is on 130XE/800XE/European 65XE only
* Some late XE's use a 68B21 for PIA; PIA is 6520/6520A on all others

The following are most of the team who originally designed the 400/800.

Subject: 1.13) What issues surround NTSC vs PAL versions of the 8-bit Atari?

Contributors to this section:
Wayne Booth, Graham Thornton, Brent Buescher Jr., Thomas Richter

Some quick definitions first:

NTSC standard: Abbreviation for "National Television Standards Committee"
TV signal standard used in North America, Central America, a number of South
American countries, and some Asian countries, including Japan.
525 lines per frame
60 half-frames per second (interlaced) = 60 Hz
Complete frame refreshed 30 times per second

PAL: Acronym for "phase alternation by line"
TV signal standard used in the United Kingdom, much of the rest of western
Europe, several South American countries, some Middle East and Asian
countries, several African countries, Australia, New Zealand, and other
Pacific island countries.
625 lines per frame
50 half-frames per second (interlaced) = 50 Hz
Complete frame refreshed 25 times per second.

PAL-M: A modified version of PAL, used in Brazil.

SECAM: Acronym for "systeme electronique couleur avec memoire"
TV signal standard used in France, eastern European countries, the former USSR, and some African countries.
625 lines per frame
50 half-frames per second (interlaced) = 50 Hz
Complete frame refreshed 25 times per second.

Now then, how do the differences among 8-bit Atari computers designed for the different world television signal standards affect users trying to use software written elsewhere in the world?

The 50Hz vertical refresh frequency of PAL machines translates into more vertical blank interrupt (VBI) time for demos and other computation-intensive graphics software, when compared to the time available for VBIs on NTSC machines with the faster 60Hz refresh frequency. So PAL demos and games that won't work on NTSC machines are usually returning from a VBI too late. Some also attempt to use more vertical resolution ("longer" display lists) than an NTSC display can handle.

Note that the reverse is also true. Software using VBIs will run more slowly on a PAL Atari than on an NTSC Atari.

Replacing the NTSC ANTIC chip in an NTSC Atari with a PAL ANTIC changes the screen refresh rate to 50Hz, allowing most of the PAL-only European software to run on a North American NTSC Atari. However, make sure your display device can support a 50Hz PAL signal first! North American Atari users can also obtain and use real European PAL Atari machines, with the same caveat concerning the display device.

Bottom line:
Software written for NTSC machines (North America) will always work on PAL machines (Europe), but software designed on PAL machines won't necessarily work on NTSC machines.

Thomas Richter mentions another NTSC vs PAL issue:
Another point is that the popular pseudo-colors used in the ANTIC-F (Graphics 8) mode are not colorful at all when displayed on a PAL TV, because of differences in the color encoding for the TV. The schematics of the XL computers include however a hack how to change the PAL version to the NTSC version (the PAL versions include two crystals, one with 5/4th of the frequency of the other. One is used for the system clock, the other for the color clock), but I never dared to apply it.

Subject: 1.14) What are the pinouts for the various ports on the Atari?

Controller Port (4 on 400/800, 2 on all others):

Subject: 2.1) What video display devices can I use with my Atari?

Most 8-bit Atari computers put out video signals in two places:

1) Radio-Frequency (RF) signal: VHF Channel 2 or 3, selectable via a switch on the computer.

Accessories needed:
a) RF Cable. (RF=radio frequency--video and audio signals in the same line)
On the 400/800 models, the RF Cable does not detach from the computer.
The output end of the cable is an RCA male connector.

b) TV Switch Box. Includes an RCA female connector for RF signal input from the Atari, input connector(s) for your TV attenna and/or cable TV company, and 75- and/or 300-ohm VHF output connector(s) for connection to the VHF input on the television. (Radio Shack carries a suitable TV Switch Box.)

2) A proprietary 5-pin DIN Monitor Jack, which includes two video signals:
a) Composite video.
b) Y/C Video, also known as S-Video:

separate composite luminance (Y) and chrominance (C) signals.

Exceptions among the computer models:
-the 400 and North American 600XL lack the Monitor Jack.
-the XE Game System includes an RCA-style jack in place of the Monitor Jack, providing a plain composite video signal only.
-the Monitor Jack on the 600XL, 800XL and 1200XL lacks the separate chrominance signal. (But it exists internally, and can be restored to the monitor jack via hardware modification.)

The pinout for the Atari Monitor Jack is in the pinouts sections of this FAQ list.

The typical Atari Monitor Cable includes the male 5-pin DIN connector on one end, and two RCA male connectors on the other end. One of the RCA connectors will carry the monophonic sound signal, and the other will carry the composite video signal. Color composite monitors were common in the mid-80's, but these days many televisions have an RCA female composite video input connector which works fine with the Atari.

You may find an Atari Monitor Cable where the video signal carried on the second RCA connector is not the composite video signal, but the composite luminance signal. These cables are for use with monochrome composite video monitors.

The ideal Atari Monitor Cable includes 3 RCA male connectors on the output end, carrying the sound signal, the composite luminance signal, and the composite chrominance signal. Only the best composite monitors include separate chrominance and luminance inputs. Commodore produced many fine monitors of this type, popular with Atari users.

Lonnie McClure provides this information on suitable Commodore monitors:
1701, 1702, 1802, CM-141, 1080, 2002, 1902, 1902A*, 1084**, 1084S**

* The 1902A used a DIN connector for chroma/luma, which makes cabling a bit more of a problem. The composite and audio connectors are standard RCA jacks, however.

** The 1084 and 1084S had more than one version. Some used the a DIN connector for chroma/luma connections, like the 1902A, while some used standard RCA jacks.

The 1902 and 1902A are very different in appearance. The original 1902 shares the same slightly rounded front case design as the 1080 and 2002, while the 1902A is has a rather square case design, and was manufactured by Magnavox (as were some of the 1084 and 1084S versions).

The separate composite chrominance and luminance signals that the Atari puts out comprise what the world has since come to call Y/C video or S-video. S-video connectors are normally Mini4. It is possible to build a cable, or purchase several adapters, that can allow you to utilize the separate Y/C signals generated by the Atari with a television (or other display device) that provides a standard S-video Mini4 input jack. This is the ultimate

display option for the 8-bit Atari.

Adapters also exist that will take in composite video or s-video, and output
a conversion of the signal as a standard VGA video signal. With such a
device, the 8-bit Atari can be used with a standard PC VGA monitor.
One such adapter is the Cheese Video Box, from TV One, http://www.tvone.com/
An earlier popular device was the JAM!! from AIMS Lab.

Subject: 3.1) What are the Atari 410, 1010, and XC12 Program Recorders?

Mass storage devices retain data even when the computer is turned off.

The Atari Program Recorders provide storage and retrieval of programs
and data on cassette tape. In addition to the digital track that stores
computer data, a second audio track is provided to play music or voice
as the program runs.

Data transmission rate: 600 bits per second.
Data storate capacity: 100,000 bytes per 60-minute cassette.
Track configuration: 4 track, 2 channel (digital data and audio track)

410 Program Recorder
- early Japan version had a carrying handle
- most versions made in Hong Kong
- 410a--Taiwan version
- permanent SIO cable - must end SIO daisy chain
- power - plugs directly into wall

1010 Program Recorder
- Chelco version has Stop/Eject, then Pause buttons
- Sanyo version has Pause, then Stop/Eject buttons
- two SIO ports

XC11 Program Recorder
XC12 Program Recorder
XCA12 Program Recorder -in same case as XC12...Poland
CA12 Program Recorder -in same case as XC12...Poland
image: http://romualdl.multimania.com/images/atari/ca12.jpg
XL12 Program Recorder -XC12 w/slight changed design. Czech/Slovak/Poland
XC13 Program Recorder -XC12 which was "T2000 ready". Czech/Slovak/Poland

---

Subject: 3.2) How do I run a program from cassette?

To run an Atari BASIC program from cassette:

1. Place the cassette in the recorder.
2. Press REWIND of FORWARD, if necessary, to bring the tape to the position
where the program is located.
3. Boot the computer to the Atari BASIC READY prompt.
4. There are several possibilities for the next step, depending on how the

program was saved, and whether you want to run the program or just load
it into RAM. Enter one of the following four commands:
a. CLOAD loads programs saved with CSAVE
b. LOAD "C:" loads programs saved with SAVE "C:"
c. ENTER "C:" loads programs saved with LIST "C:"
d. RUN "C:" loads&runs programs saved with SAVE "C:"

] Relative efficiency of the three cassette tape recording techniques:
] CSAVE/CLOAD - most efficient - fastest saves/loads - tokenized files
] SAVE "C:"/LOAD "C:" - middle efficiency - middle speed - tokenized files
] LIST "C:"/ENTER "C:" - least efficient - slowest - straight ATASCII

5. The computer will "beep" as a signal for you to press PLAY on the recorder.
6. Press the RETURN key on the computer keyboard, and the program will load
into the computer.
7. Press STOP on the recorder when loading has finished.
8. Unless you entered RUN "C:" above, now enter the command: RUN

To run an Atari BASIC or machine language program from cassette upon startup:

1. Place the cassette in the recorder
2. Press REWIND of FORWARD, if necessary, to bring the tape to the position
where the program is located.
3. Turn on the computer while holding down the START key.
But if your computer has Atari BASIC built-in and you're running a machine
language program, hold down both the START key and the OPTION key.
4. The computer will "beep" as a signal for you to press PLAY on the recorder.
5. Let go of the START/OPTION button(s).
6. Press the RETURN key on the computer keyboard, and the program will load
into the computer.
7. Press STOP on the recorder when loading is complete and the program is
running.

Subject: 3.3) What are the Atari 810, 1050, and XF551 Disk Drives?

Mass storage devices retain data even when the computer is turned off.

The Atari Disk Drives provide storage and retrieval of programs
and data on 5.25" floppy disks.

==> Atari 810 --- a 5.25" floppy disk drive
The least common denominator for the Atari. Single-Sided, Single-Density:
FM 40 tracks x 18 sectors/track x 128 byte/sector = 90K capacity
19.2Kbps transfer rate. 288RPM.
The 810 includes a 6507 microprocessor.
Shipped with DOS I (very early) or DOS II Version 2.0S
earlier MPI version- push button door opening for disk access
later Tandon version- lift door, like a garage door disk access
two SIO ports
accessories from Atari:
CX8100 Atari 810 Blank Diskettes (5 per box)

CX8111 Atari 810 Formatted Diskettes II (5 per box)
CX8202 Atari 810/815 Blank Diskettes (5 per box, certified for double density)

Third-party upgrades for the 810:
810 Archiver -- copy many copy-protected programs
Happy 810 -- Happy Backup, Warp Speed 52Kbps, 18 sector buffer
810 Fast Chip by Binary 10%-40% faster
810 Turbo by Neanderthal Computer Things (NCT) -- double-density
see: http://www.qnet.com/~dons/810T.html

==> Atari 1050 --- a 5.25" floppy disk drive
Same as the 810, plus Dual-Density capability:
Single-Sided, Single-Density, 810 compatible
Single-Sided, Dual-Density, otherwise known as "Enhanced Density" because it
is not true double-density:
MFM 40 tracks x 26 sectors/track x 128 bytes/sector = 128K capacity
19.2Kbps transfer rate. 288RPM
The 1050 includes a 6507 microprocessor.
Shipped with DOS II v2.0S, DOS III, or DOS 2.5
DIP switches: Black & white left: Drive 1
Black right, white left: Drive 2
Black left, white right: Drive 3
Black & white right: Drive 4
Third-party upgrades for the 1050:
ICD US Doubler SS SD/ED/DD UltraSpeed (US) 54Kbps, sector skewing
Happy 1050 SS SD/ED/DD Warp Speed 52Kbps, 36 sector buffer,
Happy Backup. also read/write 180K 5.25" MS-DOS floppies
CSS Super Archiver SS SD/ED/DD UltraSpeed 54Kbps (US Doubler clone)
CSS Super Archiver II SS SD/ED/DD UltraSpeed 54Kbps (US Doubler clone)
Cheer-Up 1050 SS SD/ED/DD Warp Speed 52Kbps (Happy clone)
Speedy 1050 SS SD/ED/DD Warp Speed 55-57Kbps (Happy clone)
Super Speedy 1050 SS SD/ED/DD Warp Speed 55-57Kbps (Happy clone),w/180K RAM
SuperMax 1050 SS SD/ED/DD UltraSpeed 52Kbps (US Doubler clone)
Lazer 1050 SS SD/ED/DD Warp Speed and UltraSpeed 54Kbps

Rich Mier professes:
You've been plugging and unplugging the SIO cable with the 1050 power pack
plugged in, right? That's a no-no. Most of the time it's Okay, but about 1
in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right,
rear of the main board. A 14 pin DIL chip. Actually it is an array of 5
transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be
ON on the CPU. The problem has to do with the secondary winding of the Power
Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do
it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it
'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it
won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

==> Atari XF551 --- a 5.25" floppy disk drive
Single-Sided, Single-Density, 810 compatible
Single-Sided, Enhanced-Density, 1050 compatible
Single-Sided, Double-Density:
MFM 80 tracks x 18 sectors/track x 256 bytes/sector = 360K capacity
Writes "backwards" to the second side of the disk, rendering it incompatible
with existing third-party 180K formats on the reverse side of the disk.
High speed 38400 bps burst mode usable only with SpartaDOS X, SuperDOS
5.1, TurboDOS, DOS XE, and patched SpartaDOS 3.2.
Rotaton rate: 300RPM.
Shipped with DOS 2.5 or DOS XE.
DIP switches: Both dips down: Drive 1
Left down, right up: Drive 2
Left up, Right down: Drive 3
Left and Right up: Drive 4
Chinon-built XF551-cannot read/write/format backside if no timing hole
Mitsumi-built XF551--can read/write backside if to timing hole, if formatted
Third-party upgrades for the XF551:
CSS XF Single Drive Upgrade--3.5", 720K floppy drive replacement
also read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFsingdrup.htm
CSS XF Dual Drive Upgrade--add 3.5" drive w/o losing the 5.25" drive
also read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFdualdrup.htm
CSS XF551 Enhancer--overcomes sensor for index hole, create flippy disks
see http://www.nleaudio.com/css/products/XF551enh.htm
CSS XF Update--replace drive OS, adds UltraSpeed
see http://www.nleaudio.com/css/products/XFupdate.htm

Subject: 3.5) What kinds of 5.25" floppy disks can I use with my Atari drives?

Russ Gilbert writes:
If you're talking standard computer store, you can't use those 5 1/4" disks. I
mean you can't use high density disks. They must be double density to use
with the 1050. Almost all double density 5 1/4" disks have a hub ring, high
density disks don't have the hub ring.

RHamiIton5 elaborates: (5/12/01)
The Atari 8 drives do not have write heads and circuity which can handle the
type of oxide coating used on the high density floppy media; they cannot write
reliably to them. The hub ring has just become a sort of marker to distinguish
the high density from the standard double density diskettes.

Way back in your apple days of '79-'82, most disks were hubless and only the
really premium brands offered hubs to prevent slippage and out of round
problems; you could even buy little kits for adding you own hub rings.

When the home computer swell really hit around '83 and price wars began, hub
rings became common on good disks and eventually became standard down to
include most generic bargain diskettes.

The introduction of high density 5.25's required a different coercivity (=
magnetizability) to get more bits in a smaller space and suitable electronics
to do it. These disks were produced hubless; was it a differentiating label or
just unnecessary because of stronger mylar construction? Anyone?

Subject: 3.6) What do I need to connect a hard drive to my 8-bit Atari?

==> Corvus hard drive (10 megabytes)
Fast but still relatively slow I/O, kludge through joystick ports for 800
only, connects through joystick ports 3 & 4.

==> K-Products/Supra Hard Disk Drive Interface
by K-Products (Bob Klaas)
Some limitations on drive type and size and total number of drives in sys.

==> Multi I/O (MIO) by ICD

Subject: 4.1) What are the Atari 820, 822, and 825 Printers?

Atari 820 Printer:
- 40-column impact printer
- 5x7 dot matrix
- 40 characters per line, upper & lower case alpha
- horizontal and vertical alphanumeric characters
- 6507 microprocessor, 6532 RAM I/O chip, 2K ROM
- 40 characters per second
- uses Standard Roll Paper/adding machine paper

Atari 822 Thermal Printer:
- 37 characters per second
- 10 characters per inch
- 40 characters per line, upper/lower case and point graphics
- 5x7 dot matrix

Atari 825 80-Column Printer (= Centronics 737)
- 3 character sets:
monospaced 7x8 dot matrix at 10 characters per inch
monospaced condensed at 16.7 cpi
proportionately spaced Nx9 dot matrix at avg of 14 cpi (N=6..18)
- all characters can be elongated (printer double width)
- characters per line: 80 at 10 cpi; 132 at 16.7 cpi
- speed: 50 cps at 10 cpi; 83 cps at 16.7 cpi; 79 cps avg. proportional
- print buffer: 1200 dot columns
- paper: roll, fanfold, or cut sheets
- requires Atari 850 Interface Module or equivalent

Subject: 4.2) What are the Atari 1020, 1025, 1027, and 1029 Printers?

Atari 1020 Color Printer:
- 4-color graphics: (black, red, blue, green). optional 8-pen rainbow package
- alphanumberics and X,Y plotting capability
- 10 cps (40-column mode)
- 20, 40 and 80-column modes
- horizontal and vertical alphanumerics, English and International chr sets
- water soluble ink pen technology
- 4-pen barrel print head
- microprocessor
- paper: standard roll paper (40 column width)
- AtariGraphics cassette software included
Frank McKenney writes: The printer/plotter mechanism for the Atari 1020 is (I believe) the same one used in the Tandy/Radio Shack CGP series and the Commodore 1520(?), and was made by a company named ALPS.

Atari 1025 80-Column Printer: (= Okidata ML80)
- 40 cps (80-column 10 cpi mode)
- 5 cpi expanded (40 col), 10 cpi (80 col), 16.7 cpi condensed (132-col)
- 5x7 character dot matrix
- buffer: 132 chrs at 16.7 cpi, 80 chrs at 10 cpi
- paper: roll,fanfold,single sheets. optional:roll paper holder, tractor feed

Atari 1027 Letter Quality Printer: (= Mann-Tally Riteman LQ.)
- fully formed characters, prestige elite 12)
- 12 characters per inch (80 columns)
- 20 characters per second
- single sheets or roll paper

Atari 1029 Programmable Printer (by Seikosha)
- 7-pin dot matrix, same as Commodore MPS-801
- Released for Europe only

Subject: 4.3) What are the Atari XMM801 and XDM121 Printers?

Atari XMM801 Printer:
- 80 columns, dot matrix
- friction feed or pin feed
- pica 10 cpi, double width pica 5 cpi, elite 12 cpi,double width elite 6 cpi, condensed 16.5 cpi, double width condensed 8.25 cpi
- Ribbon: Commodore 1526 and the Mannesman-Tally Spirit 80

Atari XDM121 Printer:
- 80 column, daisy wheel--letter quality
- underlining, subscripts, superscripts
- friction feed paper
- Ribbon: Silver Reed CF130, Olivetti ET201,ET221,Nu-Kote NK136

Subject: 5.1) What are the Atari 830, 835, 1030, XM301, and SX212 Modems?

A MODulator/DEModulator translates digital information from your computer into
acoustic tones that can be sent and received via standard telephone lines.

Atari 830 Acoustic Modem: (= Novation 'CAT')
- a stand-alone, acoustically coupled, frequency shift keying (FSK) modem
- up to 300 bits per second
- Bell 103/113 modem compatible
- requires Atari 850 Interface Module or equivalent

Atari 835 Direct Connect Modem:
- 300 bps
- Bell 103/113 modem compatible

Atari 1030 Direct Connect Modem:
- 300 bps
- Bell 103/113 modem compatible
- built-in ModemLink software.
- 2 SIO ports

Atari XM301 Modem:
- direct-connect
- 300 bps
- Bell 103/113 modem compatible
- with XE Term disk software
- permanent SIO cable, must be at end of SIO chain
- draws its power from the computer via SIO

Atari SX212 Modem:
- SIO & DB25 RS232 serial ports, must be at end of SIO chain
- 1200 baud
- Bell 103/113/212A modem compatible
- rarely with SX-Express! disk software.

Subject: 5.2) What should I know about modems and the Atari?

Thanks to Bob Puff and Clay Halliwell for helping me with this section.
But I'm still not real confident about the accuracy here. I'd love for
anyone to help me fix up this section!

There are three types of modem protocols: modulation protocols, error
correction protocols, and compression protocols. The international
standards for these protocols are laid down by the branch of the United
Nations known as the ITU-TSS (formerly the CCITT). ITU standards are
known by their "V-Dot" names. They're only names, don't try to apply
any meaning to the names.

Modulation protocol standards, the major ones
(bits per second)
300 bps - V.21 (103J is used instead in the USA)
1200 bps - V.22 (212A is used instead in the USA)
2400 bps - V.22bis
9600 bps - V.32

14.4 Kbps - V.32bis
28.8 Kbps - V.34

Error Correction standard:
V.42 - requires either software or hardware flow control

Compression standard:
V.42bis - requires V.42, and hardware flow control.

If your modem is capable of V.42bis compression, set your communications software to enable hardware flow control. If your terminal interface allows you to set the terminal<->modem (DTE) and modem<->modem (DCE) baud rates separately, you should set the DTE rate to the maximum allowed. If the DTE and DCE cannot be set separately, set the terminal baud rate at four times the maximum actual data rate of your modem (V.42bis achieves a compression ratio of up to 4:1). Examples: If a V.22bis/V.42bis modem is used, set the terminal for 9600 baud. If a V.32/V.42bis modem is used, set the terminal for 38400 baud. If a V.32bis/V.42bis modem is used, set the terminal for 57600 baud.

Let's define a "high-speed" modem as a modem capable of V.42bis compression. (Some 2400 bps modems, and all modems faster than that)

Using high-speed modems on the Atari

Unless you're using a CSS Black Box or a patched MIO, the 8-bit Atari RS232 interfaces do not support hardware flow control. (I have heard that the P:R: Connection does too, but it can't be controlled in software.) So we must send the modem a command to tell the modem not to use it. Using a Hayes-compatible modem, the modem command AT &K4 will enable software flow control, and disable hardware flow control. AT &K0 will disable all flow control.

The MIO patch, HyperSpeed by Len Spencer, is available at:
http://members.aol.com/lenspencer/atari8.htm

Question. Why does my modem report V.42bis is used even when my terminal it set for the same speed as my modem?

Cause the modem will do what you tell it. You've configged it to talk at the highest speed, using LAP/M, and compression. Even if you connect modem to modem at 14.4k, you can be talking to the modem at 300 baud, and it will still use everything. You'll undoubtedly drop bytes, but hey...

Question. Why does V.42bis compression appear to function after I have sent the modem the AT &K4 or AT &K0 commands? And knowing the Atari doesn't support hardware flow control?

Compression doesn't have to have flow control to work. Same as above - its just an added step that the data goes through. Note that if the modem's input buffer is small, you can overrun it easily if you send it data faster than it can digest and send. That's why you -really should- be using flow control with compression... But it's not a necessity.

Question. Why does V.42 error correction appear to work even when I have disabled flow control with the AT &K0 command?

Question. Why don't I have problems performing binary downloads when I have software flow control enabled? (flow control characters could appear in data stream accidentally)

Depends on the protocol. Zmodem accounts for spurious XON/XOFFs. Xmodem and Ymodem don't. Also, you are able to digest the data as fast as the modem is giving it to you, hence no flow control is happening. I suspect it would be a different case if you were uploading using a streaming protocol like Ymodem G.

More tips, from Clay Halliwell:
On 11 Feb 1996, Marc G. Frank said:

> I'm having problems getting a modem attached to my Atari 850 to
> communicate at 9600 baud. When I set my communications program to 2400
> baud, everything works fine. However, when I set it to 9600 baud, the
> modem echoes my characters but doesn't act on them. That is, at 2400,

The problem with the 850 is that some of them (like mine) don't produce a PERFECT 9600 baud signal. As a result modems can't train on it, and while they will echo characters back, for some nitpicky reason they won't pick up on the "AT" attention code.

The solution is to do all your dialing at 2400 baud, but set the S37 register to force the modem to try to connect at 9600. Then switch your Atari to 9600 after connecting.

Jon Melbo responded to me in 1997:

>I have a Zoom 2400bps V.42bis modem, connected through a P:R:Connection. I
>need to do the
>at&k4 no matter what I'm dialing into, and no matter what comm program I'm
>running.
>
>Nobody's ever really been able to explain it to me, but I know it has helped a
>few other people. Try it!

What &K4 does is select XON/XOFF flow control. Apparently, all/most atari serial interfaces or at least R: handler software does not support hardware (CTS/RTS) handshaking (selected on the modem via &K3 which is also a default). Anyway, that's why the &K4 setting helps a lot.

Glenn Saunders responded to other writing of Jon's, 4/5/97:
: 28.8 CARRIER connects are possible BB or no, it's just that there is
: no point in having your modem do data faster than your puter can.

It simplifies modem configuration to let the modems connect at their native speeds.

: Right! But you should never have your DCE to DCE speed exceed your
: DTE to DCE speed. Never, unless you like errors and strange behavior.
: With a BB, one should use CTS/RTS flow control, and force the modem to

: operate at a maximum of 19.2 PERIOD (this means disable compression).

It doesn't really matter. CTS/RTS can throttle the I/O down as much as it needs to. The faster modem will wait for I/O without any complaints. Disabling compression isn't a good idea because it will disable it for ALL calls including 9600 or 14.4 users in which it could do some good even on an 8-bit BBS. Software flow control is pretty much dead in telecommunication, and has been dead as long as data compression has been standard since the stop and start commands take way too long to register that way.

: If using some other serial interface, I would use software flow
: control, disable data compression on the modem, force the modem to a
: max speed of 9600bps, and experiment with error correction. Does

This combination is deadly for most modern users unless they degrade their modem via reconfiguration. And if users have to do this, odds are they will stay away rather than futz with AT settings to get a reliable connect. That's why I think the MIO essentially died as a viable BBS interface when 14.4s became standard. They won't work well unless the "mythical" hardware flow control of the thing is enabled in some way.

An explanation of XON/XOFF from Eric Sokolowsky, 4/11/97:

I looked in my modem manual, and the at&k4 command enables XON/XOFF flow control, which is a form of software flow control. As I understand it, when a XOFF is sent by the receiving end of a line, the sending end holds off sending for a little while to give the receiving end a chance to catch up. When the receiving end catches up, it can send a XON which tells the sending end to continue sending. Using this should reduce the liklihood of dropped characters. It's not as good as hardware (RTS/CTS -- check out the FC light on most high-speed external modems on fast transfers) flow control (enabled by default or the at&k3 command), but it's good enough for the Atari, which as I understand, doesn't normally allow hardware flow control, unless using such a device as the Black Box.

to which Robert Ely responded:

Just a quick addition. If you are using a modem at 9600bps or faster, don't use xon/xoff, use the RTS/CTS. Since you can do this with the MI/O and BlackBox, use it for all it's worth. If you are on an 850 or P:R:Connection, you won't be able to deal with it and probably won't be going at or above 9600bps anyway.

Subject: 6.1) What is the Atari 850 Interface Module?

Atari 850 Interface Module:
- early design all metal (black) case
- most in plastic beige case
- four 9-pin serial EIA RS232C ports

- One 15-pin 8-bit parallel Centronics-type port
- programmable baud rate on any port, including:
75, 110, 134.5, 150, 300, 600, 1200, 1800, 2400, 4800, and 9600 bps;
baudot speeds of 60, 66, 75, 100 words per minute
- uses standard ASCII. Baudot support for radio-teletype (RTTY).

Subject: 6.2) What is the Atari XEP80 Interface Module?

This text written by Thomas Raukamp.

Since the development of the Atari 8-bit line of computers in 1979, users wanted better text displays than the default 40x24. There has been some attempts to satisfy this need, like the Austin-Franklin board or the Ace 80/80xl cartridge. For more informations about these modifications read The Atari 8-bit Hardware Upgrade FAQ from David A. Paterson.

The Atari XEP80 Interface Module is Atari's entry to the 80 column field. It lets a XL, XE, 400 or 800 computer system display a full 80 columns across your monitor screen. The XEP80 provides a 256-character wide by 25-line display window. Up to 80 characters are displayed horizontally at once, and you can scroll horizontally all the way to the 256th character, depending on the application you're running. The XEP80 is connected to your system via a joystick port.

The XEP80 Module interprets commands from the computer for screen display or output to a printer. The module is supplied with an industry-standard 8-bit parallel port so you can connect a parallel printer to your Atari 8-bit (I even use a HP LaserJet IV on my 130XE ;)).

All programs that use the standard screen call (E:) should be compatible with the XEP80 Module. The software provided by Atari supports a 320x200 graphics mode - this mode only support direct bit images. Note that you can't use all of the standard graphic capabilities of the Atari anymore.

Although Atari recommends a monochrome monitor for usage with the XEP80, it runs fine with any type of composite monitor. The output looks great on my Commodore 1084 for example.

Along with the module comes a software-package containing an AUTORUN.SYS file, which is the XEP80 handler. If you want to use the module with an application that is compatible with the XEP80, which has it's own AUTORUN.SYS file, you can append the application's AUTORUN.SYS on the module's AUTORUN.SYS.
****

Subject: 6.3) What accessories did Atari produce for their 8-bit computers?

This should be a complete list of Atari "CX" accessories, two or three digit numbers, marketed for use with the 8-bit computers.

CX30-04 Paddle Controller Pair
CX40-04 Joystick Controller Pair
CX40 Single Joystick Controller
CX41 Joystick Repair Kit
CX22 Trak-Ball
CX23 Kid's Controller
CX24 Pro-Line Joystick
CX42 Remote Control Wireless Joysticks
CX50 Keyboard Controller Pair
CX70 Light Pen (beige; the original Atari light pen)
CX75 Light Pen (+ Atarigraphics cartridge)
CX77 Touch Tablet (+ AtariArtist cartridge)
CX78 Joypad (shipped with the 7800 in Europe)
CX80 Trak-Ball
CX81 I/O Data Cord (5 ft)
CX82 Monitor Cable (Black and White Monitor)
CX85 Numerical Keypad (+ software Handler on diskette)
CX86 Printer Cable (included with 825 Printer)
CX87 Interface/Modem Cable (included with 830 Acoustic Modem)
CX88 Interface/Terminal Cable (null modem)
CX89 Monitor Cable (Color Monitor)
CX418 The Home Manager Kit (Personal Financial Management, Home Filing Manager -or- Family Finances, The Home Filing Manager)
CX419 The Bookkeeper Kit/Atari Accountant (The Bookkeeper disk, CX85 keypad)
CX481 The Entertainer (Star Raiders, (Missile Command or Pac-Man), 2 joysticks)
CX482 The Educator (410, BASIC cart., States & Capitals cassette)
CX483 The Programmer (BASIC, BASIC Ref. Manual, BASIC Self-Teaching Guide)
CX484 The Communicator (850, 830, TeleLink I cart.)
CX488 The Communicator II (835, TeleLink II cart.)

????? The Arcade Champ (Pac-Man, Qix, 2 joysticks, cartridge storage case)
????? The BASIC Tutor I (Inside Atari BASIC book,Invitation to Programming 2&3)
CX852 8K RAM Memory Module (for 800 computer)
CX853 16K RAM Memory Module (for 800 computer)
XG-1 Light Gun (+ Bug Hunt cart.)

Subject: 6.4) What "vaporware" computers/peripherals were never released?

For definitive information on unreleased Atari products, see:

Atari Historical Society, http://www.atari-history.com/ (Curt Vendel)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
800D (Developers Bus System)
1000 Sweet 16 Project, lower end model. Became the 1200XL
1000-X Sweet 16 Project, higher end model. Became the 1200XL
1200 1200XL internally, many slight cosmetic differences
1200XLS 1200XL Show prototype, top-mounted cartridge slot
600 early 600XL, all black case, joyports on the left, missing PBI
800XL brown prototype
800XLD low-cost 1450XLD,no modem&speech,include disk drive controller&FREDDIE
800XLCR Cost Reduced, with CGIA chip ("Keri"), which is a combined GTIA&ANTIC
900XLF early name for 65XE
1250XLD Earlier name for the 1450XLD
1400XL brown prototype
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL 1400XL plus room for 2 internal 5.25" drives (controller not included)
1450XLD 1400XL plus 5.25" floppy drive (Epson SD521 360K disk drives)
1600XL Amiga/Amiga-like.Now appears that 1850XLD was the model name for this
1650XLD to use 1450XLD case and 1200XL keyboard
1850XLD "Mickey" Atari clone of the Amiga Lorraine
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMY sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D. some were produced!
1027 PLUS -daisy-wheel, 80 columns
1053 -looks like a 1050, but supports DS/DD 360K format
1055 -a 1050 (SS/ED) with a 3.5" mechanism
1060 CP/M Add-On Module -"SweetPea" Z-80 CPU, 64K RAM, CP/M 2.2, 80 col display
1090 XL Expansion System-5 PBI slots, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor (Goldstar)
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XF351 -a 3.5" drive.
XC35 -an XF551 with a 3.5" mechanism
XTM201 -non-impact printer
XTC201 -XE Thermal Color Printer

Subject: 6.5) What are the power requirements for my Atari components?

Thanks to Matthias Belitz for the European
data in this section. I need more international help!

As with the rest of this FAQ list, please let me know if any of this
information conflicts with the units you have.

The most important information is the voltage (in volts) required, and
whether you need a transformer (AC output) or an adapter (DC output).
The power (in voltamps or watts) and current (in amperes) specifications
of the original equipment as presented here should be regarded as
minimum values. Higher-than-specified power and current capacities are
entirely usable, and often preferable because such supplies run cooler
and last longer.

Direct Current (DC):
Power (in watts) = current (in amps) * voltage (in volts)

Alternating Current (AC):
Apparent Power (in voltamps) = current (in amps) * voltage (in volts)
Effective/True Power (in watts) = current (in amps) * voltage (in volts)
* (cosine of the angle of lag)

N O R T H A M E R I C A: INPUT = 115-120 V AC, 50/60Hz

3	800XE	03/01/1985	0x29f133f7	C300717
4	XEGS	05/07/1987	0x1eaf4002	C101687

(?) This information is missing. If someone can supply this info,
please write me an e-mail.

NOTES:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).
The 1200XL contains two ROMs for the OS (8k each), XL/XE's use a single
16k ROM and the 16k XEGS OS is stored in a 32k ROM (together with 8k
BASIC and 8k for Missile Command).

Origins of ROM information
~~~~~~~~~~~~~~~~~~~~~~~~~~
400/800 rev.A NTSC Could exist, since the PAL version exists and
rev.A is mentioned in the rev.B source code.
400/800 rev.A PAL All info found in two Atari 400's and Atari 800
ROM module CX801.P
400/800 rev.B NTSC Information from a ROM dump and the rev.B source
listing. The part numbers were listed in the
catalog from 'Best Electronics'. According to
'Mapping the Atari' rev.B ROMs have a 'B' at the
end of the part number, therefore I figure these
part numbers are from rev.B.
400/800 rev.B PAL Could exist, since the NTSC version exists and
there's some conditional PAL/NTSC assembly in
the rev.B source code
1200XL rev.10 PAL/NTSC All info found in an Atari 1200XL. The XL/XE
rev.2 source code refers to it as rev.10.
'Best Electronics' calls it rev.A.
1200XL rev.11 PAL/NTSC Refered to rev.11 by the XL/XE source code.
~~~~~~~~~~~~~~~~~~~~~~~~~~

'Best Electronics' calls it rev.B.
XL/XE rev.1 All info found in an Atari 600XL
XL/XE rev.2 All info found in an Atari 800XL
XL/XE rev.3 All info found in an 800XE
XL/XE rev.4 All info found in an Atari XE Game System

O.S. Authors and dates
~~~~~~~~~~~~~~~~~~~~~
The following info is from the Atari XL/XE rev.2 source code.

Revision A (400/800)
D.Crane / A.Miller / L.Kaplan / R.Whitehead

Revision B (400/800)
Fix several problems.
M.Mahar / R.S.Scheiman

Revision 10 (1200XL)
Support 1200XL, add new features.
H.Stewart / L.Winner / R.S.Scheiman /
Y.M.Chen / M.W.Colburn 10/26/82

Revision 11 (1200XL)
Fix several problems.
R.S.Scheiman 12/23/82

Revision 1 (600XL/800XL)
Support PBI and on-board BASIC.
R.S.Scheiman / R.K.Nordin / Y.M.Chen 03/11/83

Revision 2 (600XL/800XL)
Fix several problems.
R.S.Scheiman 05/10/83
Bring closer to coding standard (object unchanged)
R.K.Nordin 11/01/83

Vapour-ware
~~~~~~~~~~~
The following OS roms originate from rare Atari 8-bit systems.
Since I don't own any of these (unfortunately), I don't have much
information about these roms. Who can help me?

I've got two 16K rom dumps from the 1450XLD. Both ID's are rev.3.
The first dated 3/23/1984 comes from the 'Pooldisk Too' CD-ROM
(filename: 1540os3.v0) and the second dated 6/21/1984 was send to
me by Nir Dary (filename: os1450.128). Main differences between
these two are in the first 3K ($C000 - $CBFF).

The XL/XE OS rev.3B is from an Atari from Arabia. It's probably based
on rev.3. There are changes in the fonts (Arab characters) and several
patches in the code. More info at:
http://www.savetz.com/vintagecomputers/arabic65xe/

Special thanks to Nir Dary for the rev.2 source code, rom dumps and
the 1200XL. It's in good hands.

~~~~~~
More info on what is maybe either the 1985 or 1987 XL/XE OS versions listed
above. From ST*ZMAGAZINE #36, Sept. 1, 1989 (as reprinted in PSAN Nov 89):
by Mark Elliot, Innovative Concepts
The following changes have been incorporated in the 130XE computer.

The O.S. has minor changes like:
A) The MEMORY TEST (from SELF TESTS) tests the extra 64K now! (in 4 squares)
B) Also, the MEMORY TEST checks the first 48K over TWICE as fast as before!
C) The KEYBOARD TEST has the F1-F4 keys missing on top. (function keys),
although the code that interprets them is probably there (like XEGS).
D) Also, it types out "COPYRIGHT 1985 ATARI" at the keyboard test, when all
tests are done. (compared to COPYRIGHT 1983 ATARI, before)
E) And, the O.S. chip itself, is on a 27256 EPROM, but only half of it is
used! (comprared to the original, which was on a 16K x 8 ROM, 27128 comp.
~~~~~~
james adds (3/8/01):
Your faq, regarding OS Rev A, states:
Origins of ROM information
~~~~~~~~~~~~~~~~~~~~~~~~~~
400/800 rev.A NTSC Could exist, since the PAL version exists and
rev.A is mentioned in the rev.B source code.

Did exist! My parents bought me an Atari 400 w/ 410 back in 1981 for
entertainment when I was badly injured in a motorcycle accident. A
year or so later I paid good money ($40 USD or so?) to have the OS A
upgraded to OS B.

Subject: 7.2) What is the ATASCII character set?

ASCII is an acronym for the American Standard Code for Information Interchange. Pronounced ask-ee, ASCII is a code for representing English characters as numbers, with each letter assigned a number from 0 to 127. For example, the ASCII code for uppercase M is 77. Most computers use ASCII codes to represent text, which makes it possible to transfer data from one computer to another.

The 8-bit Atari computers use a modified version of the ASCII character set called Atari ASCII, or ATASCII.

David Moeser produced this nice translation table.
Piotr Fusik corrected the description of Atari character 5.

ASCII TRANSLATION TABLE -- IBM & ATARI 8-BIT (ATASCII)

Subject: 7.3) What versions of Atari BASIC are there?

There were three versions of Atari BASIC produced: A, B, and C.

At the READY prompt, enter "? PEEK(43234)"

If the result is: You have Revision:
162 A
96 B
234 C

Freddy Offenga adds:
You can also take a look at the part numbers on the IC's
inside your Atari and compare them with the numbers from
the following table:

Part# Version
~~~~~~~~~~~~~~~~~~~~ ~~~~~~~~
CO12402 + CO14502 A
CO60302A B
CO24947A C
~~~~~~~~~~~~~~~~~~~~

On versions A, B, and C, Greg Miller writes:

"Rev A had a number of bugs, not just the commonly
described crash bug. Rev B fixed most (maybe all, I don't remember) of
these, but in the process, they added a new bug. You see, the crashes
were caused by a bug in one of OSS's memory move routines. When the bug
was fixed, the fix mistakenly applied to a routine that actually worked
in Rev A, causing the new lockup problem.

Rev C differs in only a few bytes. AFAIK, the only change was to remove
the alteration made to the routine that was broken by Rev B.

You can get more details from the annotated source listing published by
Compute! books. Bill Wilkinson described many of the problems in detail.
He also talked about it in his column in Compute! magazine."

Wally Lang adds:

--- Warner's Atari issued Rev B in two formats:
(1) As a built-in Basic on 600XL and 800XL computers.
(2) As a special request order item for 400/800 and 1200XL computers.

--- Tramiel's Atari issued Rev C in both formats for XE series computers and
ALL previous Atari 8-Bit Computers.

Subject: 7.4) What are Atari DOS I, DOS II v2.0S, DOS III, DOS 2.5, and DOS XE?

Here are short descriptions of the various Disk Operating Systems (DOS)
versions produced by Atari for use with their 8-bit computers.

The original Atari DOS shipped with all 810 disk drives from 1979-1981. It
consists of a single file, DOS.SYS, which is loaded into memory from disk on
startup.
At the top of the menu screen it reads:
DISK OPERATING SYSTEM 9/24/79
COPYRIGHT 1979 ATARI
Unless you are a collector, you probably have no reason to work with DOS I.
The DOS I disk is labeled: Atari 810 Master Diskette (CX8101).

DOS II Version 2.0S was shipped with all 810 disk drives, and early 1050 disk
drives, from 1981-1983. It consists of two files:
DOS.SYS is loaded into memory from disk on startup
DUP.SYS, which contains the DOS menu, is loaded only when needed.
MEM.SAV can be employed to preserve the contents of memory to disk when
DUP.SYS is loaded, so that the data can be restored to memory when exiting
from the DOS menu. DOS 2.0S supports Atari's proprietary single-sided, single
density 90K 5.25" floppy disk format only. DOS 2.0S represents the lowest
common denominator of Atari DOS versions--you can be assured than any Atari
disk drive for the 8-bit Atari can work with disks formatted with DOS 2.0S.
The DOS 2.0S disk is labeled: Atari 810 Master Diskette II (CX8104).

DOS II Version 2.0D was shipped with the rare Atari 815 Dual Disk Drive.
This is the double density version of DOS 2.0S.

The DOS 2.0D disk is labeled: Atari 815 Master Diskette (CX8201).

DOS III shipped with 1050 disk drives from 1983-1985. It was created in part to take advantage of the 1050's Dual-Density capability, by employing a single-sided, enhanced-density 128K 5.25" floppy disk drive format. Atari called this format "dual-density," but the Atari community quickly came to refer to this format as "enhanced-density" to better differentiate it from widely available 3rd-party truly double density disk drives and supporting versions of DOS. DOS III uses a disk format incompatible with DOS 2.0S. It included a utility to convert files from DOS 2.0S to DOS III, but not back again. It used disk space less efficiently than DOS 2.0S. For these reasons and others, DOS III was not widely accepted by the Atari community, and like DOS I is not generally used except for curiosity's sake.

DOS 2.5 shipped with 1050 disk drives and early XF551 disk drives from 1985-1988. DOS 2.5 represented Atari's relenting to the masses, returning to DOS 2.0S compatability. DOS 2.5 very closely resembles DOS 2.0S, with just a few features added. It supports both DOS 2.0S single-density 90K formats, as well as an enhanced density 128K format for use with the 1050 disk drive. DOS 2.5 also includes a RAMdisk utility for use with the 128K 130XE computer, a utility to convert files from DOS III disks back to DOS 2.5, and other disk utilities. DOS 2.5 is just about as universal among Atari users as DOS 2.0S.

DOS XE shipped with XF551 disk drives from 1988-1992. Like DOS III, DOS XE introduced a whole new format for Atari floppy disks; but unlike DOS III, DOS XE also preserved general compatability with DOS 2.0S/2.5. DOS XE supports the full capabilities of the double-sided, double density 360K per 5.25" floppy disk XF551 disk drive, including that drive's high-speed burst mode. DOS XE also fully supports the 90K SS/SD capability of the 810 disk drive, the 128K SS/ED capability of the 1050 disk drive, the 180K SS/DD capability of most 3rd-party disk drives for the Atari, and a RAMdisk for use with the 130XE. Date-stamping of files is supported. DOS XE requires an XL or XE computer; it is not compatable with the 400/800 computer models. Even though DOS XE was critically well-received, and represented a substantial jump in capabilities over DOS 2.5, its arrival came so late in the crouded realm of Atari and 3rd-party DOS versions that it never achieved much acceptance among real users, and is now relegated to the same status as DOS I and DOS III before it. Before its release, DOS XE was widely known as "ADOS."

Subject: 7.5) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system.

Either MYDOS or SpartaDOS will work with almost any disk drive, up to 8 drives or hard disk partitions, and ramdisk.

MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff). There are two versions of MYDOS 4.53, one uses 3 digit

sector numbers where possible, known as 4.53/3; the other, known as 4.53/4, uses 4 digits minimum. Complete documentation about the disk formats and commands, as well as the source code, is available. MyDOS 4.53/3 was released by David R. Eichel on 12/31/89.

SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g and 3.2gx are disk-based; SpartaDOS X 4.22 is cartridge-based and includes many additional features. SpartaDOS 3.3a and 3.3b were rewritten by Stephen J. Carden for use with BBS Express PRO!. SpartaDOS 3.3c is produced on a 16K ROM cartridge from Video 61.

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
filenames: Os/dos25.arc (DOS 2.5)
Fte/fte32g.arc (SpartaDOS 3.2g)
Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Another popular, powerful DOS is BW-DOS, freeware by Jiri Bernasek.
(it is pronounced "Bay Vay Dos")

Carolyn Hoglin adds:
I didn't see TOP-DOS mentioned anywhere. This superior DOS was written by R. K. Bennett of Eclipse Software in Sunnyvale, CA. It was based on Atari DOS, but with many, many more features. It fully supports my double-density, double-sided Astra drives, automatically sensing the proper density and sidedness of both drives 1 and 2. (MYDOS only seemed to do that on drive 1.) Also supported are large ramdisks for Axlon, Mosaic, etc. The latest version was TOP-DOS 1.5+, which came with an excellent manual explaining how to use its powerful capabilities.

Any other versions of DOS all 8-bit Atari users should be aware of??
- SuperDOS 5.1
- BiboDOS 5.x

Subject: 7.6) How do I modify Atari DOS to support more than two drives?

Russ Gilbert writes:

DOS 2 type DOSes default to two drives.
Boot DOS and BASIC.
? PEEK(1802)
if it is 3 then you only recognize two drives.
To get the 3rd drive, poke 1802,7. Then go to dup.sys (type DOS)
and write system files. Next time you boot that DOS, you'll recognize
3 drives.
If you want four drives, poke 1802,15.

Subject: 7.7) Are there Graphical User Interfaces (GUIs) for the Atari?

Contributors: Andreas Magenheimer (5/12/01), Mathy van Nisselroy (5/12/01)

- Diamond GOS version 1 (PD disk version), version 2 (cart), version 3 (cart); plus some applications (painter program, text program, etc.); Diamond GOS has been made freeware by the author Alan Reeve;

- G.O.S., the Graphic operating system by Total Control systems; two different versions are avaiable (I call them GOS 1 and GOS 2) and they are PD;

- G.O.E., the Graphic Operating Environment also by Total Control Systems (this one merely works under Sparta DOS, not with Bewe-DOS and not at all with DOS 2.x); so far I have found 3 different versions (GOE 1,2,3) with some applications (graphic/painting program, etc.); PD;

- S.A.M., the Screen Aided Management (unfortunately it has the same name as SAM, the software aided mouth) from PPP/Germany. It is avaiable in two different versions: a) the type-in listing from Atari magazin and/or the Lazy finger disks (which are PD!) or b) the commercial version 2.0 which has many add-ons and can still be bought from Dean Garaghty/UK or PD-World-Versand/Germany; This GUI merely works correct under DOS 2.5 and Medium/dual density, however...

- BOSS-XL, the XL-Desktop from Mirko Sobe; written in Turbo-Basic; freeware; http://www.atarixle.de/

- BOSS-XE, the XE-Desktop from Mirko Sobe; written in Turbo-Basic;freeware, http://www.atarixle.de/

- BOSS-X the newest desktop version from Mirko Sobe, needs an 128k+ Computer (128k or more memory), supports MyDOS up to 16MB and MyDOS subdirs...; still written in Turbo-Basic; many applications and drivers; freeware; http://www.atarixle.de/

- XL-TOS a small and "cheap" GUI version from Atari magazin (i.e. a type-in listing; the basic file, which consists of many data lines creates a short object code file); unfortunately this GUI only looks good, it loads almost nothing... PD;

- ST-TOS a small basic program, that looks like a GUI; it can merely load Basic files and do a few DOS commands, like lock, unlock, delete and such... (PD)

- Basic desktop, a GUI written in Basic just as a sample, what can be done with an 8-bit computer; this one loads basic and text files (maybe also ML files); PD;

- DCS, the desktop construction set from Tom Hunt; there are 3 different versions avaiable, a) for DOS 2.5, b) for MyDOS andc) for Sparta-DOS; I have tested the Sparta DOS version, which worked with batchfiles and could easily load some ML files, text files and basic files (which were already on the DCS disk); it also works with high densities and/or hard disk partitions up to

16MB and supports subdirs of course; hmm, freeware or shareware ?!?

- ATOS - GUI by Tom Hunt/Closer To Home. http://cth.dtdns.net/atos/

- there are a lot more GUI programs, however many of them are written in Basic
or Turbo Basic and are very restricted; most of them merely look like a GUI
but need to much memory for everyday use. Thats why most users still prefer
those DOS or Gamedos (Gameloader, Multiloader, etc.) programs...

Subject: 8.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

Ice-T XE v2.72 (128K XL/XE) or Ice-T 800 v1.1 (48K)
shareware by Itay Chamiel
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: X/Y/ZMODEM download
Autodial: Yes (2.72) or No (1.1)
Backscroll buffer: Yes--8 screens (2.72) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.72) or No (1.1)
Summary: Outstanding flicker-free high-speed VT100 emulation.Recommended!
http://www.cs.huji.ac.il/~itayc

FlickerTerm 80 v.0.51, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus

BobTerm 1.22, shareware by Bob Puff
(There's also a 1.23 that's specific to PC XFormer)
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; best for BBSing
filename: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No

Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Only option combining VT100, XMODEM, Kermit; buggy at file Xfers
filename: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Only option for VT100 emulation on the XEP80; 1200bps top speed
filename: Telecomm/vt850b1.arc

Subject: 8.2) What BBS software can be used on the Atari?

Contributors to this section: Winston Smith, Steven Sturza, Chad Hendrickson,
Don Fanning.

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
The AMIS BBS was written in BASIC by people from the
Michigan Atari Computer Enthusiasts. It included designs for a ring-detector.
You needed a sector editor and had to allocate message space by hand, hex byte
by hex byte.

Steven Sturza adds:
The AMIS BBS was written by people from the Michigan Atari Computer
Enthusiasts.

o TODAMIS 1.0, for 1030/XM301, Copyright (C) 1986 Trent Dudley
Don Fanning writes:
TODAMIS was a spin off of AMIS written by Trent Dudley (of AMODEM fame).

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer writes:
FoReM BBS derived from an early AMIS. When multiple message areas were added the name was extended to FoReM 26M. Then, When OSS released BASIC XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most of the Assembler routines (where is he now?).

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE cartridge in order to run. It is in the public domain and can import and export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only, control ATASCII graphics are reserved for message data-structure bytes). FOREM-XE BBS is still currently in use as we speak, and may be reached via the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in effect.

o Forem-XE Pro -- by Len Spencer. http://members.aol.com/lenspencer/

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported features such as intra-line editors. Unfortunately, the coding of the ABBCS was really poor. You could practically blow on your keyboard and crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston, Massachusetts, USA, area. I'm not sure whether his BBS for the Atari 8-bit has been placed into the public domain or not. This BBS was the first to support a RAMdisk, which Paul Swanson called a "V:" device for "virtual disk". This BBS was written in Atari BASIC and required a joystick hardware "dongle" device. This was notable as being one of the first Atari 8-BIT BBSes that could actually go for a week without having to be rebooted. Pointers to the message base were kept in an Atari "very long string" (for which Atari BASIC is famous). The BBS would only have problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of the commercial BASIC XE cartridge to run. This BBS program was very popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It expects to be running under a SpartaDOS environment. This was a problem until very recently, when the disk-based version of SpartaDOS was re-released as shareware. This BBS program uses a "modem clock string" rather than an R-Time 8 cartridge in order to retrieve the current time. It also comes with an Atari BASIC game door called "Sabotage".

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS, which is the Keith Ledbetter companion project of the EXPRESS!-TERM terminal program of days gone by. I am not familiar with this program. I think that it is written in Action! and only supports XMODEM Checksum

transfers. I have never called or seen this program demonstrated.

o BBS Express! Professional -- a product of Video 61, www.atarisales.com
http://cth.dtdns.net/pro/pro1.html

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and comes with a "dial out" screen so that the Sysop can use the BBS as a terminal program to call and fetch files without having to bring the BBS down and reload a terminal program. OASIS supports "Door programs" which it refers to as "OASIS PAL modules". This OASIS demo module comes with an excellent message system. The OASIS file system is one of the most complicated that I have ever seen. It consists of "file libraries" with suites of "file types". There is quite a bit of overhead involved in performing a download (which may be a good thing, as it discourages file hogs). There is a commercial version of OASIS called "OASIS IV" that performs networking. There was an OASIS network between Boston, Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word of the OASIS IV developers reaches the network from New Zealand or Canada.

o OASIS IV -- a product of ???

o Frank Walters BBS -- I know nothing about this BBS except that Frank Walters wrote it.

o Carina BBS -- a shareware product of Shadow Software.

Subject: 8.3) What programming languages are available for the Atari?

Contributors: Freddy Offenga, Kevin Savetz.
Based upon a file located at http://www.student.kun.nl/f.offenga/atari.htm

==========
!!!! This section is under construction - HELP WANTED !!!!

The goal is to give information about all available languages
for the Atari 8-bit computer. This information will include:
title, last version, author, date and a short description.
It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Freddy Offenga, mailto: F.Offenga@student.kun.nl
==========

There are quite a lot! To get some structure in this section it's
divided into the following categories;

a) ASSEMBLER
b) BASIC
c) C
d) PASCAL

e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

The following format is used:

- Language title (medium)
version, year : version, year
author/company : author/company
available..... : where/how to get it
package..... : programs, documentation
features..... : main features
Description.

The question marks (?) indicate that more information is
required about that topic.

Definitions:
umich University of Michigan Atari archive

Some resources:
- The Multi-lingual Atari, Analog magazine 45, August 1986
- A bunch of manuals
- Some copy-pasted lines from the Atari 8-bit newsgroup

a) ASSEMBLER

- 130XE+ Makro Assembler (disk)
version, year : 2.2, 1992
author/company : Torsten Karwoth
available..... : freeware, ?
package..... : assembler, editor, menu, monitor,
batch enhancement, linker/packer
features..... : macros
Two pass 6502 assembler with integrated menu, editor
and monitor shell. Needs extra RAM banks. Source
format is derived from Atmas Makroassembler.

- A65 (disk)
version, year : ?, 1989
author/company : Charles Marslett, WORDMARK Systems
available..... : freeware, ?
package..... : assembler, manual
features..... : source include
Two pass 6502 assembler. Source format is based on the
Atari Macro Assembler. Assembler source included.

- Alfasm, Turbo-Assembler/16 (disk)
version, year : 1.0, 1990
author/company : Jeff Williams, DataQue Software
available..... : ?

```
package..... : assembler, docs
features..... : source include
Two pass 6502/65816 assembler.

- Atari Assembler/Editor (cart)
version, year : ?, 1981
author/company : Atari
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : -
Two pass 6502 assembler with integrated editor/monitor

- Atari Macro Assembler (disk)
version, year : 1.0C, 1981
author/company : Atari
available..... : ?
package..... : assembler, editor, debugger, manual
features..... : macros, source include
Two pass 6502 assembler.

- Atmas Makroassembler (disk)
version, year : 2, 1985
author/company : Peter Finzel, Hofacker
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : macros
Two pass 6502 assembler with integrated editor/monitor.

- Bibo Assembler (disk)
version, year : ?, 1986
author/company : Compy-shop
available..... : ?
package..... : assembler, editor, monitor
features..... : source include, data include
Two pass 6502/65c02 assembler with integrated editor/
monitor.

- Datasm/65 assembler (disk)
version, year : 2.0, 1981
author/company : DataSoft Inc.
available..... : ?
package..... : assembler, editor, menu, manual
features..... : -
Two pass 6502 assembler.

- EASMD (disk)
version, year : 1.0, 1981
author/company : OSS
available..... : ?
package..... : assembler, editor, monitor
features..... : ?
Two pass 6502 assembler with integrated editor/monitor.
```

- Fast Assembler (disk)
version, year : 1.5, 1995
author/company : MMMG Soft
available..... : ?
package....... : assembler, editor, disassembler
features...... : ?

- Kasm65 (disk)
version, year : 2.41, 1994
author/company : Ken Siders
available..... : shareware, umich
package....... : assembler, editor, linker, docs
features...... : macros, relocation, source include,
conditional assembly
Two pass 6502 assembler. Relocatable object files are
compatible with ra65. Source format is derived from
the Atari Macro Assembler.

- MAC/65 Macro Assembler (disk|cart)
version, year : 2.00, 1982
author/company : Stephen D. Lawrow, OSS
available..... : ?
package....... : assembler, editor, monitor, manual
features...... : macros, source include
Two pass 6502 assembler with integrated editor/monitor.
Mac/65 is a direct descendant of the Atari Assembler/
Editor (via EASMD).

- MAE (disk)
version, year : .96, 1996
author/company : John Harris
available..... : umich
package....... : assembler, menu, editor, monitor, docs
features...... : macros, source include, data include,
conditional assembly
Two pass 6502/65816 assembler with integrated editor/
monitor. Extra RAM supported.

- NASM65 (disk)
version, year : ?, 1992
author/company : Nat!
available..... : ?
package....... : assembler, linker, librarian
features...... : macros, relocation, source include
One pass 6502 portable cross assembler (initially for
the ST). Highly compatible with MAC/65.

- PC-65 (disk)
version, year : 1.0 beta, 1996
author/company : Jan Feenstra & Freddy Offenga
available..... : mailto: F.Offenga@student.kun.nl
package....... : assembler
features...... : macros, source include, data include,

boundary directive
Two pass 6502 cross assembler for the PC. The source
format is highly compatible with the ST-65 assembler.

- Quick Assembler (disk)
version, year : 1.0, 1990?
author/company : JBW, Avalon?
available..... : ?
package....... : assembler, editor, menu, debugger
features...... : source include
Two pass 6502 cross assembler with integrated editor.
Very user friendly menu environment.

- Ra65 (disk)
version, year : 1.0, 1989
author/company : John R. Dunning
available..... : public domain, umich
package....... : assembler, linker, librarian
part of cc65 (c-compiler)
features...... : ?

- Synassembler (disk|cart)
version, year : ?, 1982
author/company : Steve Hales, Synapse Soft
available..... : ?
package....... : assembler, editor, monitor, manual
features...... : source include
Two pass 6502 assembler.

- ST-65 (disk)
version, year : ?, 1991
author/company : A. Stauffenberg, F. Offenga
available..... : mailto: F.Offenga@student.kun.nl
package....... : assembler, menu shell, manual
features...... : macros, conditional assembly,
source include, data include,
boundary directive
Two pass 6502/65c02 cross assembler for the Atari ST
written in 68000 assembly. As far as I know this is
the first assembler with the boundary directive.

- X-Assembler
version, year : 2.4, 2001
author/company : Piotr Fusik
available..... : freeware, mailto: fox@scene.pl
package....... : assembler, docs
features...... : conditional assembly, source include,
binary include, pseudo commands,
pseudo addressing modes
Two pass 6502 cross assembler for PC. The source
format is backward compatible with Quick Assembler.

b) BASIC

- A BASIC Compiler (?)
version, year : 1.03, ?
author/company : Monarch Data Systems
available..... : ?
package....... : BASIC compiler
features...... : ?

- Advan BASIC (disk)
version, year : ?, ?
author/company : Advan Language Designs
available..... : ?
package....... : BASIC compiler
features...... : ?

- Atari 800 Basic (disk)
version, year : 1.0, 1981
author/company : Microsoft
available..... : ?
package....... : ?
features...... : ?

- Atari BASIC (cart)
version, year : Rev.C, 1983
author/company : Atari
available..... : standard ROM in Atari XL/XE
package....... : BASIC interpreter, manual
features...... : pretty plain BASIC implementation

- Atari Microsoft BASIC II (cart)
version, year : ?, 1991
author/company : Atari
available..... : ?
package....... : BASIC interpreter
features...... : ?

- BASIC A+ (disk)
version, year : 3.05, 1981
author/company : OSS
available..... : ?
package....... : BASIC interpreter
features...... : ?

- BASIC XL (cart)
version, year : ?, ?
author/company : OSS
available..... : ?
package....... : BASIC interpreter
features...... : ?

- BASIC XE (cart)
version, year : ?, 1985
author/company : OSS

available..... : ?
package....... : BASIC interpreter
features...... : ?

- Turbo Basic XL (disk)
version, year : 1.5, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package....... : BASIC interpreter, compiler (V1.1)
features...... : ?
Published in the German magazine "Happy Computer".

c) C

- ACE C (disk)
version, year : ?
author/company : John Palevich & Ralph Walden
available..... : ?
package....... : ?
features...... : ?
This is a newer version of 'Deep Blue C'.

- C/65 (?)
version, year : ?
author/company : OSS
available..... : ?
package....... : ?
features...... : ?
Probably derived from Dr.Dobbs "Small C". Compiles to 6502
code which emulates the 8080 instruction set.

- C65 (?)
version, year : ?
author/company : Keith Ledbetter
available..... : ?
package....... : ?
features...... : good macro assembler
This compiler does not support structs.

- CC65 (disk)
version, year : 1989
author/company : John R. Dunning
available..... : www.cc65.org
package....... : compiler, linker, assembler, librarian
features...... : ?
Public domain compiler. Also used as cross compiler.
Relocatable object linkage files, and the most thorough
K&R C for the 8-bit. Comes with an relocatable assembler.

- CC8 (disk)
version, year : 2.3
author/company : John Palevich & Steve Kennedy

available..... : ?
package....... : Compiler
features...... : ?
ACE C with more "real" C support (e.g. arrays of pointers
to structs). Requires ACE C runtime libs and linker.

- Deep Blue C (disk)
version, year : 1.2, 1982
author/company : John Palevich, APX
available..... : http://www.atariarchives.org/APX/showinfo.php?cat=20166
Source code "Deep Blue Secrets" downloadable at
http://www.atariarchives.org/APX/showinfo.php?cat=20179
package....... : Compiler, Linker
features...... : ?
Deep Blue C was originally an independent product, but it
then became available from APX. It converts C to pseudo-
code and then interprets the pseudo code (8080 instruction
set emulation).
Drawn from Ron Cain's public domain C-compiler (Small-C).

- DVC C (disk)
version, year : 1.05, 1985
author/company : Ralph E. Walden
available..... : ?
package....... : Editor, Compiler, Optimizer, Linker
features...... : Quite user friendly program
The compiler generates special object files (.CCC)
which can be optimized and linked. The package uses a
special DOS called DVC DOS which contains runtime stuff.

- LightSpeed C (disk)
version, year : 1.08, 1986
author/company : Clearstar Softechnology
available..... : ?
package....... : Compiler, Optimizer, Linker
features...... : ?
Runs under CLI DOS's and MENU DOS's.

- Tiny-C
version, year : ?
author/company : OSS
available..... : ?
package....... : ?
features...... : ?
First sold C compiler by OSS. This compiler was used to
compile itself! First true language "bootstrap" on any
8-bit machine (it was also available for Apple and CP/M
machines). Derived from Dr.Dobbs "Small C". Compiles to
6502 code which emulates the 8080 instruction set.

d) PASCAL

- Atari Pascal (disk)
version, year : 1.0, 1982
author/company : APX
available..... : APX-20102
Information at http://www.atariarchives.org/APX/showinfo.php?cat=20102
package..... : ?
features..... : ?
Needs two drives.

- Draper Pascal (disk)
version, year : 2.1, 1989
author/company : Norm Draper
available..... : ?
package..... : ?
features..... : ?

- Kyan Pascal (disk)
version, year : 1985,1987
author/company : Kyan Software
available..... : ?
package..... : editor, compiler, linker, macro-assembler
and manual
features..... : ?
versions: 1)64K XL/XE version supports 130XE RAMdisk 2)400/800 version

e) LISP

- INTER-LISP/65 (disk)
version, year : 2.1, 1981
author/company : Special Software Systems, DataSoft
available..... : ?
package..... : ?
features..... : ?

f) FORTH

- ValForth (?)
version, year : ?
author/company : Valpar International
available..... : ?
package..... : ?
features..... : ?

- Extended fig-Forth (disk)
version, year : version 2.0 is dated 1/15/1982. An earlier version
(exact version number not known) is dated 11/10/1981
author/company : Patrick Mullarky, APX
available..... : APX-20029
http://www.atariarchives.org/APX/showinfo.php?cat=20029
package..... : ?
features..... : ?

- fig-Forth (disk)
version, year : 1.4s

author/company : ?
available..... : ?
package....... : ?
features...... : ?

- fun-Forth (disk)
version, year : ?
author/company : Joel Gluck, APX
available..... : APX-20146
http://www.atariarchives.org/APX/showinfo.php?cat=20146
package....... : ?
features...... : ?

- Grafik-FORTH
version, year : ?
author/company : ?
available..... : ?
package....... : ?
features...... : ?

- QS Forth (?)
version, year : ?
author/company : Quality Software
available..... : ?
package....... : ?
features...... : ?

g) PILOT

- Atari PILOT (cart)
version, year : 1980
author/company : Atari
available..... : ?
package....... : ?
features...... : ?

h) LOGO

- Atari LOGO (cart)
version, year : 1983
author/company : LCSI, Atari
available..... : ?
package....... : ?
features...... : ?

i) All the rest

- Action! (cart)
version, year : 1983
author/company : OSS
available..... : ?
package....... : compiler, editor, monitor and library
features...... : fast compiler which generates good code

Needs cartridge for runtime procedures. A PD runtime
library is also available.
All variables are static, so recursive routine calls
are not possible. No floating point type (though a
PD library should make this possible). No arrays of
objects (arrays of POINTERS to objects are possible).

- Quick (disk)
version, year : 2.0, 1990
author/company : Raindorf Soft
available..... : ?
package....... : ?
features...... : ?

Subject: 8.4) What cartridges were released for the Right Slot of the 800?

Contributors: Gene, Larry White, others

Austin Franklin Austin 80 Console Software
Eastern House KISS
Eastern House Monkey Wrench
Eastern House Monkey Wrench II
Geminisoft/Sar-An Magic Dump
Geminisoft Magic Dump II
Radical Systems Cartridge Maker (eprom burner)
Block (first right cart/first "backup" program hardware device)
R-Time 8 ICD (battery-backed clock, for left or right cart slots)

Subject: 8.5) What games support 4 or more simultaneous players?

contributors to this section:
Jeff M Lodoen, Vidar \"Hawk\" Olavesen, Pat Mulvey,
Steven E. Posey (Party Quiz controllers description), Andreas Magenheimer

The following games support 4 player head-to-head play. Remember, only the
400 and 800 computer models sport 4 controller ports.

Asteroids, Basketball, Dandy, M.U.L.E., Maze War, Silicon Warrior, Survivor,
Thorn EMI Soccer, Major League Hockey

The following support 8 players on the 400/800 or 4 on the other computer
models, using the 2 controllers-per-port CX30 Paddle controllers:

Super Breakout, Worms?

The following supports 4 players on all machines, using special 4-button keypad
controllers linked together with RJ-11 jacks (standard phone jacks) to a box
with 2 joystick port connectors.

Party Quiz by Suncom

Andreas Magenheimer contributes the following:
- Networking 1-8 players/computers games:
Dataque once (1989-1992) developed a Network game+cable which lets you
connect 1-8 A8 computers together. The cable (octagon or so) could be
selfmade or bought. The game avaiable was Maze of Agdagon (shareware
from the Agda Group/Dataque). Maze of Agdagon worked on all 8Bit Ataris
with a minimum of 48k RAM. In 1999/2000 Bewesoft discovered this and
developed the game Multidash which is network-compatible to the previous
game, i.e. it can use the same network cable. But, because of its
interlaced grapic mode Multidash will only run on XL/XE computers.
Therfore Jiri included a good Gr. 8 picture how to built an easy network
cable for 2 players/computers (using a SIO cable as a nullmodem cable!)
and an -not so easy - network cable for 2-8 players/computers. The game
and its text+picture was released as freeware; it can be found on the
internet or the abbuc magazine...

in short: networking games with 1-8 players: a) Maze of Agdagon
b) Multidash

- more multi-joystick games:
MULTIJOY device by Radek Sterba (Raster), supports 8 joysticks attached to
one controller port.
Two games by Raster supporting this device: Cervi, Multris.
http://www.infos.cz/raster/atari

Subject: 8.6) What programs run only on the 400 and 800 models, and why?

The following are reported as incompatable with models other than the original
Atari 400/800. Most probably do work on XL/XE's if you use a translator to
run the original 400/800 OS on your XL/XE.

Apple Panic Broderbund

Konrad M.Kokoszkiewicz writes:

XL/XE software won't work on 400/800 if:

1) it uses shadow RAM at $C000-$CFFF and $D800-$FFFF
2) it uses RAM expansions at $4000-$7FFF controlled by PORTB $D301
3) it uses specific XL OS functions (like JNEWDEVC)
4) it uses illegal XL OS addresses.
5) it uses European Charset :)

Subject: 8.7) What programs make use of the Light Gun or a light pen?

Bertrand M. (LEXX) writes:

Bug Hunt, Barnyard Blaster, Crossbow, Crimebuster, Operation Blood, Operation Blood II - Special Forces (not completely sure about that one), Light Gun Blaster (PD), Gangsterville (Italian game written in BASIC), maybe a couple more...

James Bradford mentions:
"On the 400, the light gun /pen will only work in joystick port 4." This renders much light gun and light pen software unusable on the 400.

Andreas Magenheimer adds:
all Lightgun games can be used with a lightpen (which is not as accurate as a Lightgun however). And: all lightpen games can be used with lightgun. thus add:
- Atari Graphics (Atari) Lightpen graphic software
- 5 Matrix or Matrix 5, a PD game...
- Alien Invaders (DGS) a Space Invaders clone from the brits...
- Bembelwo (Thorsten Butschke) a sort of golf/minesweeper game, written in Quick and PD!
- Sharp Shooter (Mat*Rat) a PD game from Analog, also avaiable on cart from Video 61/Lance Ringquist
- Lightgun Shooter (ABBUC mag.) a simple shooter game, at least PD!
- Flyshot (or Flyshoot) a Turbo Basic game (PD) from ZONG, the KE Soft mag.

More:
Geisterschloss by KE Soft, 1992

Subject: 8.8) What programs have a track ball mode or support a mouse?

Contributors: Andreas Magenheimer, Mirko Sobe

Title	Keystroke Required
Missile Command (Atari)	CTRL-T
Slime (Synapse)	[T]
Shanghai (Activision)	choose controller type: ST mouse ! (plug it into port 2; if you do not have one, you have to reboot!!)

Bombdown (Roemer of Uno) choose between Joystick, Amiga
mouse, ST mouse or CX85 numeric
keypad (use port 2 for any mice)
Minesweeper (PPP/PD-World Versand) use an ST mouse in port 2
The Brundles (KE-Soft/Kaisersoft) use an ST mouse in port 2
The Brundles Editor (KE-Soft, PD) use an ST mouse in port 2
Geisterschloss/Ghost Castle (KE-Soft, PD) choose Lightgun (port 1) or ST
mouse (port 2)
10-12 games from ZONG magazine ST mouse games !! (they use port 2
(KE SOFT, now PD) and a driver
called KEMAUS.COM)
Multi-Mouse manager (PD/shareware) drivers for mice, TB, etc.
Unriagh I (german PD adventure) has drivers for ST mouse+Joystick
(stick=port 1, mouse=port2)
Unriagh II (german PD adventure) has drivers for ST mouse+joystick
(stick=port 1, mouse=port 2)
little Calculator (AMC-Verlag, PD) uses mouse only (port 2)
big UPN calculator (PD) uses ST mouse, TB, Touch tab. and
joystick; (there are different COM
files, rename the one you wish to
use to *.EXE; all drivers use port
1 - if I remember correctly)
Operation Blood (ANG/Mirage) press mouse fire or Select to start
in ST mouse mode (port 2)
Operation Blood 2 / Special Forces press mouse fire or Select to start
(ANG/Mirage) in ST mouse mode
Sprint XL (ABBUC Jahresgabe 1992) uses an ST mouse in port 2
M.O.S. (ABBUC magazine) uses an ST mouse in port 2
Multi-(Tasking-)Operating-System,
Diamond GOS (Reeve software) Version 1.0 (disk), 2.0 & 3.0
(cart.)
support an ST mouse in port 2
S.A.M. (Power per Post) german GUI, supports an ST mouse in
port 2
G.O.E. (TCS) supports an ST mouse in port 1
BOSS-X (MS-Software, Mirko Sobe) supports ST-Mouse in Port 2

RE: Missile Command, Andreas writes:
there are many different versions avaible... I know the old Atari 800
cart version, which works correct with Joystick and Trakball, but not at
all with a mouse. The newer XL version works with Mouse, trackball and
Joystick, also the newest (built-in) XEGS version of MC. But, there is
also a tape version (and maybe a disk version) of MC avaiable. I am not
sure if this tape version behaves like the old 800 version or like the
newer XL and XE/XEGS versions...

And about mice, Andreas adds:
Maybe you did not know, there is a little difference between Trackball
and ST-mouse. Although MC works with both input devices does not mean,
they are the same. they are not !! Connect the TB to an ST computer and
you see: it does not work at all !! You have to do a small conversion to

convert the TB to an ST mouse. (Plans are avaiable from ABBUC, germany).
maybe somebody already did this with Harvey`s TB (and to make things
worse: the old Atari 800 version does not support a mouse; so if the TB
has been converted to a mouse this MC version will not work with it!).

Subject: 8.9) What programs have a paddle(s) or Koala Pad mode?

Andreas Magenheimer contributes:

- Super Breakout (Atari) breakout clone
- Live Wire (Analog) tempest clone
- Live wire 2 (Analog) tempest clone
- Planetary Defense (Analog)
- Pong (Antic) Pong clone
- Pong (Analog) Pong clone
- Super Ball (Compy Shop Magazin) Breakout clone
- Arkanoid (Taito/Imagic) Breakout clone
- Koala/Micro-Illustrator (Island graphics/Koala Ware) graphics program
- Chiseler (Antic or Analog) a breakout clone
- Slime (Synapse) a slimy shooter...
- Chicken (Synapse) catch the chicken eggs...
- many more dozens of Pong and Breakout clones
(forgot their names, maybe someone can help here!)
- many more programs (which I do not remember right now!)

Subject: 8.10) What programs have a CX85 mode?

Andreas Magenheimer writes:

- Multi mouse Management (PD)
- UPN calculator (PD)
- the Bookkeeper (published by ???)
- Bombdown (Roemer of Uno)
- many games from KE-Soft and Powersoft
(forgot their names, help needed!)

Subject 8.11) What programs have a Touch tablet mode?

Andreas Magenheimer writes:

- Atari Artist (Atari) graphics program
- Pixel Artist Deluxe 1.3 (PD) graphics program
- The Brundles (KE-Soft) Lemmings clone
- many more (which I do not remember right now!)

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
filenames: Archivers/uudecode.bas, Archivers/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
filename: Archivers/yau.arc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
filename: Utilities/uue.arc

Dumas UU-coder by John Dunning
filename: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The archives contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
filenames: superarc.arc - both Super Un-Arc & Super Arc
suprarc2.arc - Super Arc
supunarc.com - Super Un-Arc
supunarc.uue - Super Un-Arc
location: http://www.umich.edu/~archive/atari/8bit/Archivers/Arc/

Subject: 9.3) What are the .DCM, .ATR, .XFD, .SCP, and .DI disk image formats?

These are all filename extensions used to name files containing entire 8-bit
Atari floppy disk images.

DCM - Image format invented by Bob Puff, for his Disk Communicator 3.2 utility.
Used when working with native Atari hardware.
DCM specs at: http://home.planet.nl/~ernest/diskcomm.zip

ATR - Image format invented by Nick Kennedy, for his SIO2PC project.
Used with most 8-bit Atari emulators running on other computer platforms.

XFD - Image format invented by Emulators Inc, for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used with ST Xformer and PC Xformer emulators.

PRO - Image format invented by Steven Tucker, for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.

SCP - SpartaDOS SCOPY image file.

DI - Image format invented by Kolja Koischwitz & Christian Kruger for their
800XL DJ emulator for the Atari ST.

One tool for converting among all of these disk image formats is:
Acvt v1.06 by Jindrich Kubec
Latest version can be found at http://www.asw.cz/~kubecj

Subject: 9.4) What are the .XMO and .BIN file formats?

XMO stands for XMODEM. The idea was that the file was not plain text,
but was a binary file. As a binary file, it had to be downloaded using a
file transfer protocol such as XMODEM. The use of ".xmo" as a filename
extender was popular once, but has been discouraged for years.

BIN - another filename extension sometimes used to designate binary-load
files. Like .xmo, use of .bin is discouraged.

On 10/5/01 Ron Hamilton wrote:
> Originally .COM files used the file start load address as the execution
> point; they were normally called by their name typed at the command
> processor prompt. Often these were external components of the file
> management system or similar utilities and expected to find data in
> predetermined buffers and code or pointers present from a specific DOS
> version.
>
> .EXE files used the Atari DOS 2.0 convention of appending a load segment
> containing the execution address to be placed into $2E0-1 or $2E2-3.
> Usually these were complete applications and were rarely DOS specific.
>
> .BIN files in their simplest form were just binary RAM images of data or
> code; they were not intended to execute immediately after the load.
> Multiple load stages were possible, but typically no INIT or RUN address
> was included.

Subject: 9.5) How can I make my commercial boot disk (tape, cart) into a load
file or disk image?

Russ Gilbert writes:

The disk image part is a matter of taking a copyable boot
disk and making an atr, xfd, dcm or other disk image type
file out of it, usually for use with an emulator. Before
emulators, the Bob Puff .dcm format was used to
store/archive/retrieve boot disk images.

Almost all commercial software for the A8 is/was copy
protected. For boot disks, this usually involved a large
number of special formatting that couldn't be copied using
ordinary sector copiers. Usually the boot process involved
checking to see if a certain sector error occurred, then
proceeding. If the error did not occur, the disk was a copy

and would not work.

For carts, usually the method of protection was to write to the cart area of memory and see if the value changed. If the value changed, the cart program was in RAM, not ROM and would fail to operate.

For tapes, again a fair number of schemes were used. Some varied the speed at which the tape loaded. I'm not familiar with tape protection schemes.

With all software media (cart, tape, disk), there may be program encryption, which must be decrypted before the program can run. This to make more difficult disassembly of the program.

There were/are a number of products to defeat copy protection/allow copying of protected software for the A8. The most common way to defeat copy protection was to disassemble the software and revise sections of code so that the copy protection was defeated. A software with defeated copy protection is called a 'cracked' software. The basic procedure is to understand how cart/tape/disk software initializes, loads and runs. Usually make a file out of the software and 'follow the code', starting with loading of the program, to decryption to the actual running of the program. Today, it is unnecessary to copy original commercial A8 software because it has already been defeated and may be found at a few ftp sites. (Note umich archive has no commercial/non-shareware software.)

Besides 'cracking' software, there were/are hardware devices to copy commercial protected software. The Happy 1050 and the Archiver, and probably other modifications to the 810, or 1050 allowed 'bit image' copying and reproduction of the special formatting that copy protected disks had. Using these archiving disk drives, a copy of the original disk, including all special formatting and the original code is copied, thus making a copy protected copy, not cracked, just like the original.

For carts, copying could involve cracking or again there were/are products to reproduce the cart and simulate a ROM. Or the cart might be copied and burned on the correct type of eprom, to make a plug in cart. 'The Impersonator', the 'Pill' are two cart copy schemes copy the cart to a file, then don't change the code, but use a 'dummy cart' to fool the software into thinking there is a ROM present.

Basic tools for copying, then cracking, carts and disks are a sector editor and disassembler. Carts are usually most easily dumped using a special OS, like Omnimon, to interrupt

the cart and dump memory to disk. There are a few pd cart copiers that have the user plug the cart in when the program is running, I don't believe these pd cart copiers are very good or very wise to use.

So, the basic answer to 'how do I make a copy of my copy protected commercial software' is don't bother. Find it on the net.

There is one exception, in that this 'solution' involves a minimum of effort and is relatively safe. I refer to 'Chipmunk' and 'Black Patch' software to make cracked boot disk copy of commercial disks. HOWEVER, even if you use these two commercial archival tools, be sure you write protect your originals, and be careful not to accidentally write to the original disk.

Finally, I'll mention a very modern (I mean 1997) product. The APE Pro system, by Steven Tucker, in the registered version of this shareware allows making disk images called 'Pro' images. APE (Atari Peripheral Emulator) requires a cable, called the SIO2PC cable, that connects the A8 13 pin serial port to a serial port on the IBM PC clone. To make 'Pro' images, a special adapter cable is needed, not just the 'standard' SIO2PC cable. The 'Pro' image can 'capture' the copy protection of an original commercial disk. The 'Pro' image can then be loaded into an A8 using the APE registered version software, thus backing up your original disk software. Note the 'Pro' image will only be of use to person(s) owning registered APE software and 'Pro' adapter cable.

Subject: 9.6) How can I convert my commercial boot tape into a cassette image file?

Ernest R. Schreurs writes:

For those of you that like ALL classic Atari software, there is now a way to store all software that has been recorded on cassette tapes on the hard disk of your PC. I have written a program that is similar to the SIO2PC utility written by Nick Kennedy. But this one is intended for use with cassette software. You will need the following items:

Any PC equipped with a sound card and about 50 to 100 Megs of free disk space to work with. The sound card should be able to sample sound at a sample rate of 44.100 Hz mono. The sample must be recorded into a .wav file.
You need the wav2cas program to convert the .wav file to a .cas file. The .cas file is a digital cassette image file that only contains the data that is on the cassette tape. Once you have that, you can throw away the .wav file. The .cas files are typically 16 to 64K, so they

are relatively small.

To load cassette files into your Atari (i.e. boot a digital cassette
image) you do not need a sound card. You do need a SIO2PC cable or
similar device. You also need the cas2sio program.

The wav2cas and cas2sio programs should be available from the archives
of Umich by now. They have been put together in one zip file
wav2cas.zip, along with the documentation and the 'C' source code.
You can download it through the web interface at the URL
http://www.umich.edu/~archive/atari/8bit/Emulators/Peripherals/wav2cas.zip
Note the capital in Emulators and in Peripherals.
Thanks to William Kendrick for helping me get it uploaded there!
You can also try the gopher stuff:
gopher://gopher.archive.umich.edu:7055/11/atari/8bit/Emulators/Peripherals/

Steven Tucker, the author of APE, has added support for this file
format as of version 1.15 of APE. It looks real neat, so try that out
too! Thanks to Steven for adding a nice user interface for these
cassette images. He did a nice job. I am hoping other using are
willing to write some programs to get more enjoyment out of this
underrated storage medium.

My stuff is available totally free for personal use, so I hope you
enjoy it. Read the docs about the conditions.

Subject: 10.1) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
filename: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
filename: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
filename: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett with Mark Vallevand, and
SpartaDOS disk utility by Mark Vallevand
filename: Diskutils/myutil.zip
includes best version of UTIL for read/write of SS/DD 180K Atari disks,
plus Mark's SpartaDOS disk utility v0.1e to access 180K SpartaDOS disks

Ataridsk V1.2 (c) 95-12-09 by HiassofT (Matthias Reichl)
http://www.horus.com/~hias/atari/

MyUTIL and the XF551 - tips from JTKIRK:

]MyUtil works fine with the XF551. The XF551's speed is 300 rpm (sometimes even
]up to 303 rpm). I've got two XF551s and can read/write disks written on a PC
]with MyUtil on both with no problems. MyUtil even can write to a DS/DD disk,
]for a total of 360 K, BUT: the ATARI disks not only have the bits inverted,
]the second side is also read BACKWARDS respect to PC disks. That is, when
]MyUtil on the PC writes to what it thinks is sector 721, it really is writing
]to sector 1440! Worse, if you take an ATARI disk with a file whose sectors
]get past sector 720, MyUtil will attempt to read the sector 2161-n instead of
]'n', and you'll get a 'truncated record' error. The solution is simply to
]rewrite the code to take into account this (if sec>720 then sec=2161-sec).
]Let me know if you modify this. You don't know how frustrating it is to have
]to use only 180 K of a 360 K disk! I'm going to analyze the source code, but
]I don't know if I will be able to modify it properly. If someone does it
]before, please email me and send me an uuencoded copy or tell me where to get
]it.

Here's some advice on using the above utilities from Hans Breitenlohner:

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (288 rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)
Konrad Kokoszkiewicz answers:
"The XF551 disk drive is not slowed down - these drives are spinning
300 rotations per minute. To prevent troubles with read/write disks
formatted and written on normal Atari drives (288 rot/min), the main
crystal frequency for the floppy disk controller is 8.333 MHz
(not 8 MHz, as in 1050, for example)."

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo sums it up this way:
So a basic rule of themb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of
course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
filenames: Xf2/anad207.zip, Xf2/anadisk.txt
Apparently 2.07 is buggy.
Anadisk 2.06 is available at: http://ch.twi.tudelft.nl/~sidney/atari/

Deana by Nate Monson - converts AnaDisk dump files from Atari format
filenames: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to Preston Crow:
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 10.2) How do I transfer files using a null modem cable?

This section by Russ Gilbert.

Q: How do I connect two cmputers using a null modem cable?

A: You need a term program and RS 232 ports on both
computers. The RS 232 ports need to be connected
together using a 'null modem cable'.

For up to 4800 baud, no flow control lines need be
connected. Just cross the transmit and receive lines
and join the grounds together. Transmit is pin #2,
receive is pin #3 and ground is pin #7 on the 25 pin
port. 25 pin #2 goes to Atari #4 (XMT to RCV), 25 pin
#3 goes to #3 on Atari (RCV to XMT) and #5 of 850 goes
to #7 of 25 pin (GND to GND).

The right hand pin on the 'long' side of a female 'D'
connector is #1. There are 13 holes on this 'long'
side, 12 holes on the 'short' side. The numbers go

to the left 1 to 13 then #14 is under #1 and left again so that #25 is under #13.

Most term programs allow a null connection, without a carrier detect. Notably, 'Express 850' does not. I have only used 'Procomm 2.4.3' (the last shareware version of Procomm) on the PC and Bob Term on the Atari, but other term programs may work.

To check your null modem connection, start both PC and Atari term programs, set baud to 2400 or 4800 on both computers. No parity, 8 data bits, 1 stop bit on the PC. Be sure to use the correct COM port on the PC. Go to 'terminal' mode and you should now be able to type on either computer and see it on the other screen. To accomplish a file transfer, use Y-modem probably from Bob Term, rather than X-modem. X-modem will often append bytes to a file transfer, an undesirable event. There is also a very nice Z-modem recieve program for the Atari, called AtarZmodem by Larry Black for the Atari.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors (Radio Shack) some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modems and plugging in the null modem cable into the two modem cables. This also avoids the confusion of variations in the computer ports. Most computers connect into the modem end via a standard RS232 DB25 connection. With this both ends 25 pin cable, you would cross pins 2 and 3 and connect the #7s together to make a null modem cable.

The SIO port on the Atari cannot be used directly. An 850, P:R: connection, MIO, Black Box or similar device that provides an RS232 port must be used.

Following are pin assignments for a DB25 pin RS 232 C port.
1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

For higher speed connections, above 4800 or 9600, you need the flow control lines and Atari term software that has flow control built in. You also need an MIO or Black Box, which uses the PBI (parallel bus). A high speed

cable would need not only XMT, RCV, and GND, but also
flow control lines. I suggest a commercial null modem
from computer store to ensure correct lines. A null
modem is a small adapter with the correct lines already
crossed. I don't know how to correctly connect the CTS,
RTS, DTR, DSR, CRX lines for a high speed null modem.
With a null modem, you just plug it into the 25 pin
connectors of the two modem cables you might already
have connected to your Atari and PC or Mac. You may need
a straight thru 25 pin gender changer also.

Following is in this FAQ elsewhere, but I summarize here:
(Figure out or look for pin numbers on the ports.) Note
that these are pin assignments, and NOT null modem
connections with the XMT, RCV crossed and GND straight
thru.

Atari 8-bit PC AT 25 PC AT 9 pin
----
1. DTR 20 4*
2. CRX 8 1*
3. XMT 2 3
4. RCV 3 2*
5. GND 7 5
6. DSR 6 6
7. RTS 4 7
8. CTS 5 8
9. No connect? shield RI
22 RI

Note: * above indicates the difference between an AT 9 pin
and a Atari 8-bit 9 pin cable connector. eg. If you check
continuity from pin 3 of 25 pin end and it goes to pin
4 of nine pin end, you have an Atari serial cable. If pin
3 of 25 pin goes to pin 2 of 9 pin end, you have a PC
serial cable.
(updated 3/1/99)
(DTE = Data Terminal Equipment ie. your computer.
DCE = Data Communications Equipment ie. your modem.)

Subject: 10.3) What is SIO2PC?

From the SIO2PC home page, written by Nick Kennedy:

SIO2PC is a hardware & software package interfacing the 8-bit Atari to PC
compatible computers.

The original idea was to have the PC emulate Atari disk drives so Atari
programs could be stored on the PC's hard (or floppy) drives. It turned out to
be quite successful. About 95% of my work was in the software, but a hardware
device to convert logic levels was also necessary. This device is now commonly

referred to as an SIO2PC cable.

Features:

Emulates 1 to 4 Atari disk drives

Store your Atari files on PC hard or floppy drives

Boot from the PC, real drive not needed to start-up

No software or drivers required for the Atari;
no conflicts: use your favorite DOS

Twice as fast as an Atari 810 drive and more reliable

Co-exists with real drives in the Atari daisy chain

Compatible down to the hardware level: use sector copiers, etc.

Print-Thru captures Atari print-out and routes to PC's printer

Convert Atari files to PC files and vice versa

1050-2-PC version connects PC directly to Atari disk drive

Nick Kennedy
http://www.cswnet.com/~nkennedy/

Another source for building SIO2PC cables is Clarence Dyson's page at
http://www.redshift.com/~cdyson/atari.html

Subject: 10.4) What is the Atari Peripheral Emulator (APE)?

David A. Paterson writes:

"Steven J. Tucker took SIO2PC one better and wrote new software. The
Atari Peripheral Emulator (APE for short) lets your PC act as high-speed
drives. It lets you print to your PC printer. And it lets you use your
PC modem on the 8-bit."

The APE ProSystem goes even further. The ProSystem has two components:

- The program PROSYS.EXE is used to create the protected and unprotected
disk images which are then used by APE.

- The ProSystem hardware is a device designed to allow direct connection
of a stock 1050 disk drive directly to a PC for use by the PROSYS.EXE
software.

APE home page: http://www.atarimax.com/

Subject: 11.1) How did Atari get it's name?

Graham Thornton types:

This article was published in "I/O - The Magazine of the Atari Home Computer Club" in issue 3 - Summer 1983. The magazine was the official mouthpiece of Atari UK. The article was not attributed to any one person. The words are theirs, not mine.

How Atari Got It's Name

The name Atari actually comes from Japan. And yet the company is most definitely American. Every wondered why? It's an interesting story and one well worth telling.

In 1972 three friends decided to invent and market the first commercially feasible video game. They were Nolan Bushnell, Ted Dabney and Larry Bryan.

To become a partner each man had to submit $100 to the project - a remarkably small sum when you consider the company's success! The next step was to find a name.

Drinking beer and thumbing through the dictionary one day, the three friends came across an interesting entry under "S". The word was Syzygy, or "the straight-line configuration between three celestial bodies". What a perfect name they thought, for three such astronomically talented people!

Now they could get on with the business of inventing games. Their first, Computer Space, was produced and all seemed to be going well.

But then things started to get a little shaky. Larry Bryan decided not to ante up his $100 and pulled out, leaving Bushnell and Dabney to go it alone.

The set up a shop in Santa Clara, California, and incorporated the business. A little later they invented Pong(r).

Busnell and Dabney applied for the name Syzygy to the Office of the California Secretary of State, which regulates Californian corporations, but were told that they were too late. The name was already taken.

Following unsuccessful attempts to buy the rights to the name from the first Syzygy corporation, which appeared to be inactive, the friends' solicitor pressed them to think up an alternative.

This proved difficult. BD Inc and DB Inc were tested and then rejected in turn: the first bore too close a resemblance to Black & Decker, the second to Dunn and Bradstreet.

Inspiration occurred at last, once again in an informal atmosphere. Bushnell and Dabney were both keen players of Go, a Japanese strategy game, and their best brainstorming always occurred over a good game and a bottle of beer.

This time, they decided to make a list of several Go words to see if one of them would fly as the new corporate name.

First choice was "Sente", which means "the upper hand" - something that greatly appealed. Second and third choices were "Atari", which has a

similar meaning to the English word "check", and "Hanne", an
acknowledgement of an over-taking move.

Busnell and Dabney submitted the list once again to the Office of the
Californian Secretary of State, which approved "Atari". The rest is
history.

When the company name changed, Bushnell and Dabney decided to update the
logo too. They incorporated the "S" from Syzygy and the "A" from Atari
into the new design.

It was not until later, as the company became increasingly successful, that
an advertising agency designed the slicker and now famous Atari logo - the
"fuji" or stylised "A" design.

Subject: 11.2) What is the History of Atari?

Here is a very condensed history of Atari, centered around their 8-bit
computers.

1972
Atari Inc. is formed by Nolan Bushnell, incorporated on Tuesday, June 27.
Atari created the first coin-operated arcade video game with the introduction
of Pong. The video game industry was launched and has shaped pop culture ever
since.

1976
Warner Communications acquires Atari Inc.

1977
Atari launches the Video Computer System (VCS), later known as the 2600, giving
birth to home video game systems.

1978
In December, Atari announces the Atari 400 and 800 personal computers, using
the 6502 microprocessor.

ATARI BASIC: (according to Atari BASIC Sourcebook)
Paul Laughton and Kathleen O'Brien - Most of Atari Basic
Paul Krasno - Helped with Trnscendental routines
Bill Wilkinson - Designed Floating Point Scheme
Bob Shepardson - Modified IMP-16 Assembler to accept special syntax tables
Paul invented
Mike Peters - Key punching and operating

1979
The Atari 400 and Atari 800 Home Computers debut at the Winter Consumer
Electronics Show (CES) in early January.

Jerry Jessop writes:
"The first official small shipment of the 400/800 was on August 29th 1979.
These were hand built pilot run units to Sears that needed to be in stock by

Sept. 1 so they could be placed in the big fall catalog. The units were placed in the Sears warehouse and then immediatly returned to Atari after the "in stock" requirment had been meet.

The first "real" consumer units were shipped in Nov. of 79 and were 400's to Sears followed very shortly by 800's."

This extremely long URL leads to Atari's patent for the 8-bit Atari computer: (thanks Rick Cortese)
http://164.195.100.11/netacgi/nph-Parser?Sect1=PTO2&Sect2=HITOFF&p=2&u=/netahtml/search-bool.html&r=94&f=G&l=50&co1=AND&d=pall&s1=atari.ASNM.&OS=AN/atari&RS=AN/atari

All Atari computers are tested at the factory by a master computer called the Atari Sentinel System.

1981
November: 400/800's begin shipping with the new GTIA chip in place of CTIA, increasing the palette of simultaneously displayable colors to 256 and adding 3 new graphics modes. CTIA is totally phased out by the end of the year.

Jerry Jessop adds:
"The very first proto systems did have the GTIA, but it had some problems and was not released in the consumer version until 1981. The GTIA was completed before the CTIA."

1982
The introduction of the 1200XL in late 1982 marks the single largest advance in the 8-bit Atari system.

1983
In 1983 Atari replaced the 1200XL/800/400 line-up with the new 800XL and 600XL.

1984
Warner Communications sells Consumer Electronics and Home Computer divisions of Atari Inc. to Tramiel Technologies on Monday, July 2.

Atari Corporation is formed by Tramiel Technologies and its products marketed under the Atari brand.

(
Atari Games Corporation is also formed from the former coin-op division and markets coin-operated games under the Atari Games brand.

Atari Games inherits Atari copyrights/trademarks/patents for use in the coin-operated arcade video game market only.

Atari Games was acquired by Midway Games on March 29, 1996.

January 2000: Atari Games is renamed Midway Games West, and games produced by the group will sport the Midway Games brand. The last coin-op game with the Atari Games logo: San Francisco Rush 2049, released in 1999.

June 22, 2001: Midway Games announces it is exiting the coin-operated arcade video game market; its game development efforts will now be focused on games for home game platforms.
)

1985
The new Atari Corp. delivered on its promise to advance the 8-bit Atari system by replacing the 800XL/600XL with the new 130XE and 65XE in 1985.

1987
In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system.

1992
Atari (US) officially dropped all remaining support of their 8-bit computer line on January 1, 1992. (Some 800XE's were still being manufactured in China in 1992.)

1996
On July 31, 1996, Atari Corp. became a JTS subsidiary. JTS Corp., with headquarters in San Jose, Calif., was founded in 1994 to design, manufacture and supply enhanced-capacity hard disk drives for the notebook and desktop personal computer markets.

1998
On February 23, 1998, JTS sold its Atari Division to HIACXI Corp., a wholly-owned subsidiary of Hasbro Interactive, Inc., which is a subsidiary of Hasbro, Inc., for $5 million in cash.

(JTS filed for Chapter 11 Bankruptcy Protection on December 11, 1998, and then converted it to Chapter 7 on February 28, 1999)

Hasbro Interactive produced games for several platforms, including PCs running MS-Windows. Some of Hasbro's games, including several re-makes of classic Atari titles, were marketed under the Atari label. The Atari Interactive brand was termed "a Hasbro Affiliate."

Games produced by Atari under Hasbro ownership included:
Atari Arcade Hits 1 & 2, Breakout, Centipede, Frogger, Glover, H.E.D.Z. - Head Extreme Destruction Zone, Missile Command, Nerf ArenaBlast, Pong, Q*Bert, The Next Tetris, Atari Greatest Hits

2001
On January 29, 2001 Infogrames Entertainment announced completion of its acquisition of Hasbro Interactive from Hasbro. The purchase included the Atari titles and intellectual properties.

TODAY
Atari is a label of Infogrames Entertainment.

Founded in 1983, France-based Infogrames Entertainment SA (IESA) is a global publisher and distributor of video games for consoles (Sony, Sega, Nintendo, and Microsoft), personal computers and Macintosh systems, as well as interactive digital television, mobile smart devices (WAP, HDML) and in-flight entertainment systems. The company's award-winning franchises include Alone In

The Dark, Driver, Deer Hunter, Test Drive, and Unreal. Infogrames Inc.'s Humongous Entertainment division is a leader in children's entertainment software and its Macintosh publishing label, MacSoft, is the number one publisher of Macintosh entertainment software. IESA recently acquired Infogrames Interactive, Inc. (formerly Hasbro Interactive), including its line of software based on well-known licenses such as Monopoly, Jeopardy, Tonka, and Atari.

I was there too. But only until 16.30 (that's 4.30 pm for you
non-europeans. :-))

I'll send Wolfgang a message.

BTW the diashow works here. I'm forced to use Explorer.

There where a couple of magazines in the early 80's (or late 70's) that had bound-in "records" (those flimsy plastic 33 1/3 RPM records you had to put a coin on for weight) containing software. I believe Interface Age and perhaps another magazine had them.

As far as I can remember, I saw an ad in a magazine (I collect
computer magazines from the 80's back) that shows a photo with a
small, 45 rpm turntable with a disc labeled "business programs in
Basic". I've seen also a 33 1/3 rpm LP that says "BASIC programs for
the office". So I think it was not strange to see LPs with software
back in the days of Altair, Apple and TRS-80.

If I remember correctly, one of the first issues of UK gaming magazine
"Computer & Video Games" came with one of those very flimsy 7inch vinyl
things! (We are talking very early 80's here)

6460. Electronics for the Atari

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-02 19:11:59 UTC
From: ajpalacios@netscape.net
Message-ID: <6f45253f.0111021111.11318c45@posting.google.com>
Source record: 33385

I am an instrumentation electronics engineer and I'd like to join with a story and an offer.

First, let me tell you I was a child with arthritis because of a Joystick (just kidding), so when computing became affordable (here in Mï¿½xico, computing classes were way too rare and too expensive until 1990), I learned programming and immediatly figured out that I could program my Atari 2600 and Intellivision in a snap. Wrong! I then discovered the platform differencies and incompatibility issues.

When I was about to enter the University, I got and Atari 65 XE game system and immediatly started writting programs just for fun and for art's sake. I started playing around with the paddle inputs so I sould measure light. I was in the middle of my career when I started using my 65 XE to check out circuit designs for Digital Electronics I and II. I used the joystick ports as outputs (thanks to a magazine article I found in a trash can in my faculty's library) and injected bit streams to my circuits because I had no signal injectors nor a logic analyzer.

Now I'm working and have too little or no time at all for making Atari based circuits. I've enrolled in a new adventure that is creating a moving sign and I want it to be Atri Controlled. I have nothing but a cassete recorder (XC-12) and two systems: the 65XE and the 65XE Game System. I use the second for definitive use and the second to test modifications. I'm also planning to build an EPROM programmer, a PLD programmer, a Real Time Clock (in cartridge), a security system, and a garden or greenhouse controller (check humidity, turn on water sprinklers, check temperature, etc.)

I do not know anything about Atari OS, disk management or cable adapters. I've heard a lot about them here in this forum. But I have no idea how to make 'em, buy 'em or hack 'em. Anyway, I plan to make my own if you help. I'd like to connect a matrix printer (like the Star NX-1001) to my 65XE, just the way I do it with my C64 (I love it too). Since I know to program AVR microcontrollers, I think I can make a lot with it.

Now, the deal is this: Anyone interested in an Atari based device can contact me and we could design it. All I need is schematics and some references (I'm learning haow to interface to the cartridge port by now), and I'll work as hard as my job lets me. When any device I develop gets finished and tested, I'll give it away to as many persons as I can. No $ accepted!! All free!! My payment will be the periodic reporting of how it works. I've ever hated that people asks for money in exchage of knowledge, so this is my payment.

Good deal, don't you think? I really have no money to buy schematics, plans or pieces from the USA (shipment charges are sometimes 10 times the price of a schematic!), but I can buy parts here and assemble gizmos and sen them to anywhere in the world (sending is a lot cheaper than receiving in Mï¿½xico).

Well guys, I hope you to get interested. If you don't, I don't care. I've learned a lot from this groups anyway!

Right, I had have the all files and original disk games from Atari 800, and when i buyed my Atari 1040 ST, i have selled all my 500 disk with side A and side B writed for a cents, if you understand, and now i have get my Atari 800 with a 1050 disk drive to play with extra games into cartridge and 5 disks with the best games !
Now i want to retryve all the games into files or disk images for to revive my old Atari 800 ! Thank you for your answers. Egidio.

At the rate he's generating off topic posts he'll go broke soon...
then perhaps it will stop. Not the best solution perhaps, but
a solution none the less. It's his choice.

You can connect a text (7 bit) parallel printer to the joystick ports easily as long as you have access to install the driver which excludes many commercial applications. The plans were in an early (#16-25) issue of Analog.

6470. REAL Carina II BBS online and accessible via the Internet!

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-03 15:36:21 UTC
From: Chad Hendrickson <chadh@REMOVETHISmediaone.net>
Message-ID: <V9UE7.129795$P8.44557201@news1.elmhst1.il.home.com>
Source record: 33394

The Dark Side of the Moon BBS is back and running Carina II on a REAL ATARI 130XE! This is NOT an emulator!

You can now "call" DSOM over the internet. First, you will need to get ATS 2.0 (Atari Terminal Simulator) from www.atarimax.com and then connect to "dsom.sytes.net". Just like the old days, only one person can be connected at a time. If someone is connected to it when you try to call, you will receive a message telling you to try again in a few minutes.

There may be bugs with the board... it may lock up on you... etc. Please email me at dsombbs@home.net if you encounter a problem and if you could include a screen shot (alt-printscreen) that would be great! I predict that at first, the board will be down more than it is up while I work out the bugs.

Please try to logoff the board properly and close down your connection properly.

Yes... there are online games... including RoboWar II and Zenobia!!!

I plan on adding a lot of stuff to the board... especially old archive material such as old user lists, messages, bulletins, text files, etc. It is a work in progress.

Anyways, go at it and let me know what you think.

>on my old Atari, I'm baffled why someone who pays by the second
>does not...

I can tell you why: Because generally it costs more that way *and*
wastes considerable time! I used to download headers only, but
found that a) it took ages to look through and select them, b) I
probably wanted to download most of them anyway as the headings
weren't clear enough to make a decision on and c) it then needed a
separate blink to get the posts - so at least another phonecall or
wait until the next blink, which may not be till a day or so
later. So I decided that a full download was preferable.

On the matter that started all this, strictly speaking Steve is
right as commercial ads are banned in private newsgroups by the
RFCs, I think. Personally I don't mind seeing Ben's adds now and
then, but not every week (at one time he used to post it twice!)
and not at such length. I think it would be better if he posted
either a summary, or just a link to a web page with perhaps a few
highlights of what's new. Just my 2 cents worth!

Regards, /Peter/

6477. Minigame competition - a reminder

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-04 21:38:20 UTC
From: gasman@raww.org.RemoveThisBit.invalid
Message-ID: <914FDA13Agasmanrawworg@163.1.2.7>
Source record: 33401
Cross-posted to: comp.sys.sinclair,comp.sys.cbm,comp.sys.atari.8bit,comp.sys.amstrad.8bit

Just to remind you there's one week left to send in your votes for the Minigame competition (you know, the contest to find the best 8-bit game written in 512 bytes or 2K of code), to decide upon a winner.

Up till now, votes have been a bit slow in coming in. Hopefully this just means that there'll be a last-minute rush of votes, just as there was for the entries themselves - either that or people are afraid of going over to the Dark Side and actually downloading an emulator for that arch-rival computer :-) If it's the latter, please don't be put off... a lot of sterling work has gone into the entries from all sides, so it's well worth checking out - and clear instructions for running the emulators are included, in the download pack and on the website.

The website? Oh yes. http://demo.raww.net/minigame/

The deadline for voting forms is Friday 9th November...go on, take part. You'll like it, oh yes you will.

Matthew Westcott

6478. FA: INFOCOM ZORK II and A MIND FOREVER VOYAGING

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-04 22:34:24 UTC
From: J Dogg <jcdove@bellsouth.N0SPLAM.net>
Message-ID: <myjF7.7909$LD.159357@e3500-atl2.usenetserver.com>
Source record: 33402

Two Infocom classics. The ZORK series is well known and beloved by many an adventurer! This ZORK II for IBM PC is in the box with what appears to be all the contents! I tested the 5.25" disk on my venerable Compaq Portable III. I about choked up when I saw "There is a strangely familiar brass lantern here."

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1292127206
or see it at http://www.devmage.com

A Mind Forever Voyaging was quite a departure from the standard Infocom formulaic FIND-ITEM-DROP-ITEM-OPEN-DOOR game. It utilized special commands and featured a uniques story line in which you are AI meant to map out future feasibility studies in a VR environment! Confusing?! Yes! But also one of the best and least known Infocom all-text games out there!

See more at http://www.devmage.com !

To the best of my knowledge, it's (1) both times.

When you do a GET it will wait until a character is available.
When you do a PUT it will wait until the buffer has room (I am a bit less
certain of this one though).

Now i can add arse licker to tight fisted git.

Who says that commercial ads are banned ?

Get a life you sad muppet.

Anyone that supports the platform should be welcomed as a valued contributor.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

6491. Re: no stickers will be dark shallow walnuts

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-05 22:02:12 UTC
From: spamless@Nil.nil
Message-ID: <3be70c64$1_1@nntp2.nac.net>
Source record: 33415

This is a post of HipCrime's (or a HipClone).

He is a spammer.

This is not one of his spam runs, but a punishment run.

He shares his code (for generating random Markov text,
finding open Proxies and using them to post hundreds
of thousands of messages to USENET, etc.) with his
"followers" (HipClones).

He considers himself to be the Lord High Ruler of Usenet
and spammer king. Those who do not accept his rule are
targetted for punishment.

Among his favourite targets are NANAE (news.admin.net-abuse.usenet)
and NANAE (news.admin.net-abuse.email).

He used just to send hundreds of thousands of harassing posts
to the groups. They block him based on the path in the header.

His current method is to post hundreds of thousands of harassing
messages to various groups with the Followup-To header set to
the group he is currently targetting for punishment (currently NANAE).

If you reply or post an irritated followup you will be doing his
work. The From address is forged (often being that of a regular
in one of his targetted groups). The Followup-To header will
have your message redirected to flood the group he wants to
punish (which will be unable to block messages based on the path
since the followups come from all over).

The current message is a Mime Attachment, HTML formatted,
JavaScript message to write (in a new browser window) text
pretending to format your hard drive. Two weeks ago the
harassing messages were obscene JPGs of Bin Laden buggering
Bush. Who knows what they will be two weeks from now? Maybe
just plain random Markov text.

The headers from his post are:

Bob Puff released the floppy board for the Black Box that enables the 8bit
Atari
to use 1.44Meg floppies. I do believe there's a utility that enables you to
transfer
files between the 8bit and a PC formatted floppy.

The Black Box floppy board is the only one I know of that can do this.
There may
be some products made in Europe that I'm unfamilar with.

Bob Puff also sold a 3.5 inch floppy drive upgrade for the XF551 that came
with a utility
to read 720k PC formatted disks. But it could only read the disks. The
XF551 doesn't
have enough buffer RAM to support the 512 byte sectors for writting
purposes.

Below is the link to Bob Puff's web site. There you will find a link to the
CSS stuff. There's
even source code available for the Black Box utility.

Hopefully one of the above links will point you in the correct
direction. I haven't tried any of these adapters, as I've been quite
happy with my Logitech Wingman Rumblepad (nearly identical to the PSX
dual schock analog controllers). Still, at times, a digital joystick
would be nice on the PC.

I'm not familiar with the 1050 to PC cable.
But the problem may be your trial APE software.
APE trial disables writes from A8 to PC.
You could try Nick Kennedy's sio2pc software.
Or buy the APE.
Seems Steve Tucker could make the disabled features report
better than it does, if I recall it just doesn't work and leaves
you thinking something is wrong with your setup.
I think a way around it is to make a DCM, using SpartaDOS.
Seems APE trial will allow writes using SpartaDOS. Then
extract the DCM using Bo Schreur's xdir, if I recall.
You would run Bob Puff's Disk Communicator 3.2 to on
your real A8 to write the DCM to an image in APE.

6502. HELP - converting Atari disks to ATR

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-06 11:56:00 UTC
From: switchblade <xxx@nospam.com>
Message-ID: <kdQF7.10102$BJ3.151934@news.easynews.com>
Source record: 33425

Hello

I have recently invested in a SIO and 1050 to PC cable. However, I am having no luck in trying to back up my disks to ATR format. I bought this to basically back up all my multiboot / Rob C / Alpha-Load menu disks onto the PC, as the 5.25 disks are getting a bit old now.

I am using the trial APE/Prosystem, which has detected my 1050 US Doubler drive.

I have tried a number of disks of varying format:

3 x Alpha-Load menu disks (double density?)

1 x normal Game disk (1 game per side)

Neither of these worked. The Alpha-Load menu disks abort after a few sectors (cant remember the error, but think it was "unexpected error" or "CRC" I will check later). The game disk went all the way through but complained about CRC errors and empty/dead sectors toward the end of the disk.

Has anyone had any success with this Prosystem and 1050 US Doubler, together with Alpha-Load and multiboot menus? Dare I try a ROB C menu or Ian C menu??!

Worryingly, my treasured 1050 is now making a high pitched whining sound (which it never did before) when I put it back on my 800xl!!!

Is this 40 quid down the drain, together with a now possibly broken 1050?!!!

Help!

Paul

Source record: 33429

The Dark Side of the Moon BBS is back and running Carina II on a REAL ATARI 130XE! This is NOT an emulator!

UPDATE: I have revived my old ICD MIO and have now added a whopping 256K RAMDISK to the BBS. This means a lot of things a much faster. I am still optimizing it but right now you will notice a big increase in speed.

You can now "call" DSOM over the internet but you must run a Telnet program that emulates ATASCII. First, you will need to get ATS 2.0 (Atari Terminal Simulator) from www.atarimax.com and then connect to "dsom.sytes.net". Just like the old days, only one person can be connected at a time. If someone is connected to it when you try to call, you will receive a message telling you to try again in a few minutes.

Please email me at dsombbs@home.net if you encounter a problem and if you could include a screen shot (alt-printscreen) that would be great!

Yes... there are online games... including RoboWar II and Zenobia!!!

I plan on adding a lot of stuff to the board... especially old archive material such as old user lists, messages, bulletins, text files, etc. It is a work in progress.

Anyways, go at it and let me know what you think.

Chad
aka Dioskilos

Hi!

For those who want to build an adapter for connecting atari joysticks to a PC and use them with your favorite emulator, give my adapter a try!!! You'll find the schematics to build it here :

http://kukenan.dyndns.org/a2pc/

This a new version of my old Atari-to-PC joystick interface (http://users.swing.be/atari/joystick.html). I recommend the new version. Easier to build, less components and cheaper.. This new version also support the second button of some gamepads, as the SEGA megra drive gamepad..

Enjoy..

Emmanuel.

Just to confirm, I'm using the PoSystem (1050 to PC) part of APE, with the software directly accessing my 1050.

Obviously I don't want to purchase a product that doesn't appear to work with my disks!!

I use the APE for DOS v117. I haven't registered it so I believe the Doubler
and Happy features aren't enabled. I just use a stock 1050 and it works
great for 720 and 1040 (SD,ED) atari disks. Using the Prosystem that comes
with APE I can even backup copyprotected disks for use on an emulator.

Excuse me but this doesn't quite register with me as sounding right.

Here is the problem: The ProSystem Cable with the software does not return errors except as kind of a status report. Are these the errors your are talking about? I mean the basic Pro software just chugs merrily along accepting all the errors the drive generates and appends the bad track, CRC errors, etcetera to of the image.

The other thing is, are you sure you are copying disks with a format the non registered version of ProSytems supports? It is really very limited, I think I could back up Ultima III. Just about every other piece of software I had used more sophisticated copy protection that the demo program wouldn't copy.

Hello all!

I was just downloading a demo version of Elite from Ian Bell's (one of the programmers) site for the 8bit (www.iancgbell.clara.net).

I tried the ATR with Atari800Win PLus 2.8 but the program chrashes as soon as a key is pressed. Does anyone know whether the title screen is all there is to see in this demo version? Plus, does anybody have a clue how far Elite was developed on the XL/XE?

(I've always preferred "Mercenary" anyway...) *ha*

Cool!

I thought it was a version from way back as I saw it advertised "soon
available" in several magazines at the end of the eighties. I didn't realise
it is still under development. Is that the very version which was to be
published then? Or when did you start writing it?

Thanks,
Frank

Message-ID: <hV2G7.13823$M21.2814165@typhoon.nyroc.rr.com>
Source record: 33442

Hello all, long time no see!

Speaking of XL Search -- I just used it to look up downloadable ATRs for the Boulder Dash Construction Kit, and found a wealth of things. Kudos to Bill and whoever else is/was involved in creating/maintaining it.

I have only one problem this evening. One of the images I downloaded was one called "Boulder Dash Construction Kit Data" (.atr in .zip), at ftp://ftp.spudster.org//pub/atari/cth/games/atr/b/boulderdash_construction_kit_data.zip. Unfortunately, this image appears to be corrupted. Using it under Atari800Win PLus 2.7b (for Windows; sorry Bill), I can use Atari DOS 2.x or MyDOS to view a directory listing full of interesting-looking .CAV filenames, but any attempt to access any of them results in sector-linkage errors (Error 164 in DOS 2.x). MyDOS and OS/A+ fare no better. Sector-dumping, to the extent I can perform it (hex only, using a program I myself wrote), indicates that, indeed, the sector links are messed up, or at least don't correspond to what the directory (at sector 361 decimal, anyway) says. The image is bootable and when booted presents a simple title page indicating that this is "Boulder Dash Construction Kit Data Disk #1" from Mega Magazine, but doing nothing further.

Anybody know whether there's some "trick" to using this disk (image)? Special DOS required, hidden "real" directory, other trickery? I find it hard to believe that an "unusable" image would sit in the archive for any length of time... So, what am I missing?

(E-mail, please, even if you also post here; I don't get here nearly as often as I'd like, anymore. :-(Thanks in advance.)

Not an unreasonable idea. I considered experimenting with BROADCASTING one
of my Atari cassettes over my high school FM radio station, back in the late
70s/early 80s, but never actually had the nerve to subject the entire
community to 20+ minutes of that horrible shriek... :-) Would've been a
cool after-hours transmitter-test experiment, though. ;-)

The problem with that device is that it requires a a special windows driver
so that your windows could use and recognize the connection through the
Parallel Port. I don't think this cable will work with emulators working
under DOS. The advantage of my device is that the connections go through the
PC gameport, and the computer doesn't even notive the difference with this
device and a standard PC joystick or game pad. So you can use it with any
software which is expecting an analog joystick connected to the game port.
And it supports TWO joysticks....

Source record: 33445

Well,
in eastern germany they had been broadcasting 8-bit software via fm
radio. it was simple basic software and very slow (tape speed). but it
was avaiable for different 8-bit computers. all you needed, to run the
program on your own system (an atari for instance) was a special loader
called "basicode". you can find this program in several atari pd
libraries, as soon as it has been loaded it says "basicode v.1.0" and
"READY". Thus, quite a lot of A8 users think they have loaded another
(unknown) basic version, but thats wrong. its just that special loader
for the radio broadcasted software. it was illegal in those days, but
eastern germany (a communist country at that time) did not care about
it. nowadays it is almost useless, since no-one broadcasts these
software anymore - but collectors might want to have it in their
collection (as for the memories of the old days). -Andreas

Well,
are you sure, you tested it with MyDOS (or TopDOS) ?!? Since MyDOS does
not use sector links in Medium/Dual/Enhanced/1050 Density (and TopDOS
also) you will always get an Error 164 when trying to read such a
disk/directory or trying to access the files with DOS 2 or DOS 2.5 and
(fully) compatibles.

(Fully compatible means here: sector 720 is ALWAYS unused, there are 2
VTOC`s in medium density, one at sector 360 and one at sector 1024;
quite a lot of DOS versions make use of sector 720 - thus you lose one
data sector when reading/copying such DOS files with DOS 2.0 or 2.5;
even more DOS versions do not like the DOS 2.5 medium format and behave
differently, they do not have sector links and/or a second VTOC,
etc.) -Andreas.

Not the same I'm sorry to say. I too saw in Page 6 way back
that Elite was being ported. Rumours were abound that there
was an agreement between Acornsoft (AS) and Firebrid
(I think they did the other ports) that AS would OK the port
and that the A8 version (with page-flipping etc) outshone
the BBC version and was canned. Don't believe any of this,
Ian Bell has stated that NO A8 version was done. (Although
I did have a conversion with someone who's friend wrote
cart games for Atari UK and they were supposed to have a
prototype... ;-) I would have expected a demo version to
have floated around the scene by now if one existed so
I doubt there ever was one (I though that about Barbarian).

Since my uni days I've been slowly disassembling the C64
version and understanding how its put together, last year
I got to porting the graphic and text routines enough to
get the demo together (inspired by Christian Pinder work
on the PC remake Elite - The Next Generation). The game
loop is a bit harder to port but that'll be my next task,
hopefully to be able to launch the ship and fly around.

I'm also having the XE super-cart circuitry squeezed into
the old-style cart-case board. Once this is done I can
write a bank-switching cart version (its a couple of weeks
away from producing a prototype, the disk image version will
be free but the cart can be ordered - tape version anyone?).

Regards,

Mark

Why not just buy and use the Williams super cart that Lance sells at
Video 61? I'm sure he'd give you a fair price, probably lower than setting
up and manufacturing a new prototype.

FamilyNet Newsgate

I was curious how the Atari 800 keyboard differs from a Atari ST (1040STE for example) keyboard.

I was wondering what it would take to get a ST to recognize a Atari 800 keyboard for it's own use.

Open to fun theories on this. You are even welcome to ask why I would try something like this for sanity's sake. :)

Thanks,

Doctor Clu

I know what you mean. Mine are getting old also. What disks are you
trying to convert. Chances are, they are already converted. That is the
case with me. I have only a few that are not. There are tons of
ATR/DI/XLD images available for download...

I've discussed this with Lance off thread and
their boards, although being highly configurable,
are a pig to populate compared with the XE super cart
design. Also the availability of XE cart cases is
not as good as the older style, hence the desire to
use the smaller board.

A couple of things come to mind here. First its doubtful that
alpha-load disks are copy protected. If your getting CRC errors and
other errors trying to read the disks, you may have a defective drive.

Try cleaning the heads on the drive, these are easily contaminated
by just one bad disk, often making all your others fail to read until
the drive is cleaned.

Also test the drive speed to make sure its still near normal.

6535. Help with ATR images from real disks (again)

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-07 20:32:31 UTC
From: xxx@switchblade.com
Message-ID: <uTgG7.44277$gy3.490867@news.easynews.com>
Source record: 33258

OK

I am now at home, and my 1050 US doubler is attached to my PC via 1050-2-pc cable.

APE trial version is running (Windows version, under Windows ME), and I have started ProSystem and I am now sat at the screen "Read disk in to .ATR image".

I have succesfully generated one image, which was from an enhanced density "multi menu" multiboot disk. This disk at first would not run in Atari800Win emulator, however after using APE to "sign and seal" it worked ok.

HOWEVER - I am now trying to generate an ATR of a double density "ALPHA-LOAD" menu disk. This is what I get...

Click START on the above mentioned screen

Messages display:
[Drive 1] 1 Side(s) 40 Tracks 18 SPT 128 BPS
[Drive 1] Attempting to set speedy 1050 "fast-mode"

The first dot on the disk progress thingy shows green, and then I get a messagebox

"Prosystem for Windows95/98.... Unusual Error [Bad Frame Checksum].

Hopefully someone knows what is going wrong here?!

Making a ST keyboard for the 8-bit. You are a massaquist. Hehehe... (I'm one to talk). So out of curiousity, why a 8-bit in a ST case? I personally find the sexy tan look of the 400/800 more appealing. :)

Well as far as the ST keyboard goes, my education came from reading the Spectre (Macintosh emulator for the ST) manual that Dave Small put out as he was telling his humorous yarn about how he wrote the keyboard interface while coding to Neil Young music (a great story). What he had to say was...

"This was really hard, and I struggled over the design for a long time. Problem was, on the Mac, the mouse was run directly by the 68000 via interrupts, coming through the SCC chip. On the ST, the mouse is run by the keyboard microprocessor, which periodically interrupts the 68000 to tell it where the mouse moved to. Very different. Also, on both units, the keyboard was run by a standalone microprocessor, and the codes returned were totally different."
Spectre GCR manual page 27 by Dave Small (1989)

> : Open to fun theories on this. You are even welcome to ask why I would
> try
> : something like this for sanity's sake. :)
> Why :-)
> I know the 800 keyboards are better, but you won't have enough keys I guess..

I just find the sexy tan appearance of the 400/800 more appealing. And I wanted only one keyboard on my desktop. I have a ST in a 800 looking computer case that controls SIO2PC, 80 column interpretation, Macintosh Emulation, and so forth. Just would like to be able to switch my Atari 800 keyboard to work as a Atari 800 keyboard or as a ST keyboard (for those few times when a keyboard would really be nice on the ST).

You may try my PC util called ADIR. Extracts all files but last three
(will look at it later, maybe that's just the bug). You must explicitly
use -mydos switch.

: I was wondering what it would take to get a ST to recognize a Atari 800
: keyboard for it's own use.

I want to do the opposite. I have a 130XE in a ST case, but the keyboard is a problem, since the 8-bit keys are rastered and directly connected to the POKEY, where the ST is using a serial interface. I started to make my own keyboard (re-wiring an old terminal keyboard with XE and ST keycaps) but this is a hell of a job!

: Open to fun theories on this. You are even welcome to ask why I would
try
: something like this for sanity's sake. :)

Why :-)

I know the 800 keyboards are better, but you won't have enough keys I guess..

Stupid me, I tested the files with my BDash file viewer later and all
were invalid. Indeed, the file is broken. But you can put three missing
sectors to sector $10 and then extract it with my util. ;-)

Howto:
aext -n 790 orig.atr part1
aext -s 790 orig.atr part2
aext -n 180 -e 1680f orig.atr secs
copy /b part1 + secs + part2 bad.atr
acvt bad.atr good.atr (reply 1 when asked for repair mode)
adir -dos2 -e good.atr (will extract all files except for wall.cav,
which is incomplete {at least I didn't find the missing sectors
anywhere})

All of the above utils (except for copy ;-) are available on my site.

Your link below was truncated and the image is curious. Two boot sectors I have not digested, but it is mostly a display list and screen data for '1991 Megazine...'. The shifted directory contains 64 entries for 5 sector .CAV files and the VTOC was zeroed.

The VTOC and direcory sectors have been moved down 3 sectors from DOS 2.0/2.5 format to 357-365 and most of the files begin 3 sectors lower than directory entries indicate and have links shifted 3 sectors higher. All in all, a sort of jumble unless the game module is expecting data to be relocated. Only files zero and one are correct and intact while file two is partially overwritten by file three. File three should begin at sector 19, but starts at sector 16 and links to sector 20 while the data is in sector 17? This situation repeats for the final 60 files in the directory except for the EOF sectors in each chain.

The disk can be reclaimed for 2.0/2.5 usage by:
a) Recreating vtoc and directory in proper area,
b) Correcting 61 directory entries,
c) Adjusting 244 forward pointer links.

A is easy, B is quicker than it sounds and C can be automated on the Atari with a fairly simple routine.

Essentially, when you use the ATS program, you are telneting to the BBS. But with ATS, it emulates the ATASCII that is needed to connect. I figure that if you are going to "call" an Atari BBS, you might as well do it the right way... in ATASCII mode.

If you try to just use a normal telnet program, it will tell you that you need to connect in ATASCII mode.

Source record: 33272

Remember RoboWar???

ROBOWAR II is online and waiting for you!!!

The Dark Side of the Moon BBS is back and running Carina II! This is NOT an emulator!

You can now "call" DSOM over the internet but you must run a Telnet program that emulates ATASCII. First, you will need to get ATS 2.0 (Atari Terminal Simulator) from www.atarimax.com and then connect to "dsom.sytes.net". You will then be connected to a REAL Atari 130XE in ATASCII mode. Just like the good old days!

After you are connected, go to the RoboWar section by typing "go robowar" and then type "game" to play RoboWar II!

The CRC signing function only changes a few bytes in the ATR
header that Atari800 probably just ignores anyway.

I have heard of only two ways to recover the disk...one is to send it to a service. $$$$$

The other involves taking apart the disk, heating a regular iron(if its to hot to touch, its to hot to use). Unplug it, and when its cool enough, use it to flatten out the media. Parchment paper should be used to let the iron slide over the media without scratching.

Its better to start of with an iron thats too cool, and warm it up more each time. You will need a disk housing, new or the old one to put it back in. UNPLUG the iron before using.

You have a 50% chance of recovering the disk, maybe.

You may have to use a sector copier to recover the data.

There is so much to decode in a DVD it's not even funny. Happens to be another hobby of mine, making DIVX rips off of DVD's. DVD's have macrovision, mpeg2,several audio streams (all in stereo). The encryption itself requires an algorithm to decode along with the content scrambling system (CSS). It's hard enough for a pentium to keep up with, I don't think an Atari would be able to 'hack' it. If there was an MPG1 player for the 8bit, you could rip DVD's into MPG1's and do it that way- of course you'd have the problem of storage space for the MPG's.

Yep I'm able to load that disk on a real Atari, and the other 50 like it!
I'm wondering if APE doesn't know about "alpha-load" disks... maybe they
were peculiar to the UK only? Maybe Paul Irvine can shed some light on
this...

I own both the 'dual drive upgrade' and the 'floppyboard'. What I'ld like
to do is use my Atari to repair PC disks, so I don't have to use my Dad's
PC. (I own 7 computers, 2 130XE's, 2 XEGS, 1 800XE, 1 800XL, 1 65XE, no PC)

The PC Bridge is a nice thing in that it enables you to connect standard PC
ISA cards to the computer, like hercules, RS232, network, etc. (no network
card software yet).

Howdy folks

I seem to run into problems while adding features to CDAP.
As of version 129, it locks up everything after a CD change (could this be a problem related to me poking into screenmemory directly, more on this you can find on my homepage)?
In my latest, yet unreleased version (139), it locks up totally. Could it be that I'm using to many variables, or jump through to many procedures?
(139 is not on my site yet. If somebody wants to have a look at it, I can post it there. Same goes for 129. I could upload 128 and 129 so you can see the difference.)

CU Mathy van Nisselroy

No, I remember a program for the Atari that if you had 128 K or more RAM, you could simulate 2 Atari's thus emulating mutli-tasking. What I propose is a true-multi-tasking system on one hand, but on the other, seperate virtual machines that act as one. Ideal for programmers who get frustrated in writing programs but don't want to keep saving & loading code. Make sense ?

That's one of the reasons I made snapshot. Two or more virtual
computers, stored in the extended ram banks. Snap almost instantly between
them, and whatever programs you had running in the virtual machines would
still be there. Is this kind of what you were talking about?

And Closer To Home BBS ;-). There have been a few other part time A8 BBSes on the net over the last year or so. Perhaps with this new conversation going on they might put them up full time. Then maybe we can exchange networked message packets. Sigh, just like the old days. Heck, I'm even considering putting up some online games. Remember these games?- Pro! Arena, Colony, Chess, Dog Race, Nebula Elite, Kingdom, Hamurabi, In Search of Lady Lisa, Roulette, Saga, Online Text Adventure Game #1, and War at Sea? Nebula Elite was probably the most popular. These all were Pro! games. My favorite on Carina was single player ATASCII trek game. I don't think that any of the A8 BBS games were ever networked though.

Well hello fake-email person. :)

Yeh, as it stands, the 8-bit Atari fido was let go just short of 2000 I believe. The Atari 8-bit and ST crowd have funneled into the Atari St fido, which continues on with a constant stream. I have checked the fido from my account on the Family-Net BBS, which you can access at:

www.family-bbs.net

Here is the traffic on the Atari ST fido...

The monkey wrench is ment for the right cartridge slot.
It should be inserted there, place basic in the left cartridge slot,
and then boot your machine.
Can't remember how to activate the wrench at this time...

APE has its own built in R: handler, like the PR Connection and
850 interface. Just use a 850 boot loader to download the
handler.

In spartados its called RS232.

I talked to Ralph about 2 years ago, all he had left for the Atari
was a box of MPP printer interfaces you probably could have crushed a
small car with.

I managed to get a few SIO cables, everything else was gone. =[

Unless its some strange special format it shouldnt matter whats
on the disk. If you have any extra disks your welcome to send me one
and I will make sure its compatible for you, or make it that way.

You might want to have Carina look and see if CD is up to tell if
its connected. I think its waiting for the RING/CONNECT string right
now and is occasionally missing it if its busy cleaning up after the
last caller.

If it looks for CD instead in WAITCALL it should catch a
connection right away.

I just read an interesting article by Larry Black created in 1997, in which he asks the FIDO coordinators to please drop "Draconian restrictions" in order to keep FIDO a dynamically evolving, progressive private network. It can be found at http://www.magnet.ru/fido/fido1450.htm , then hit control-f and search for his name.

Doesn't the videocard do most of that? I mean, decode MPEG's? If these was
a way to directly connect the DVD mech to an MPEG2 decoder....
But MPEG2 decoders have non-ISA slot's I guess? (Roland Scholz' PC-Bridge
has ISA slots to connect PC ISA cards to 8 bit Atari's.)

```
Hi

I'm looking for a "a la" PCTOOLS file manager for the 800XL.
It should look like this (I love ASCII ART):

>D1:< D2:
+----------------------+ +----------------------+
! >FROGGER.EXE 24< ! ! PROGRAM.EXE 54 !
! PACMAN.COM 65 ! ! !
! MONTEZUMA.EXE 26 ! ! !
! ! ! !
! ! ! !
! ! ! !
+----------------------+ +----------------------+
3 Files, 115 bytes 1 Files, 54 bytes

[C]opy C[H]ange drv [D]elete [R]ename [E]dit E[X]it

Where >text< is text in inverse video.
At tha bottom, typical filename functions (Copy, Delete, etc.)
and if I hit the key "C", FROGGER.EXE will be copied
to drive D:. If I hit E, a new screen will show the content
of FROGGER.EXE like this, allowing to edit it.

D1:FROGGER.EXE, 54 bytes

=B(Y#/Y= 12 32 32 65 98 98 98 98 <<
=#B&#FR? 12 87 89 98 78 88 75 55
B)(F/)B/ 54 54 45 54 65 65 98 98
OKLNSN() 87 87 87 87 87 85 55 77
!"($/$NH 12 87 89 98 78 88 75 55
239057vv 54 54 45 54 65 65 98 98
8b7489b7 12 32 32 65 98 98 98 98
4903t7v0 87 87 87 87 87 85 55 77
48409v0' 12 87 89 98 78 88 75 55 >>

[E]dit [S]ave [U]ndo [P]rev [N]ext E[X]it

What program for the 800XL have a look like this,
and has these typical file functions?
Any recommendations?
```

hi doctor,
no he hauled a semi-truck load of software to the dump, and had it crushed even thou i had bought the first load, and told him once it was here, and unloaded that i would buy the rest.
tens of thousands of carts, and disks new in the box, including many titles that he found that he thought that he was out of because he was packing them for me and found them, including infocom, ultima, even more alternate reality.
i cannot get it out of my mind, it haunts me daily.
you can find commodore anywhere, but atari stuff was hard to find even in its hayday, and ralph was a weird one, he put no value on this stuff even when he was doing well with it in the 80's, all he ever did was complain,
thanks,
lance

I've never heard of XEX files, do you mean EXE? On Atari systems,
file extensions are just part of the name and have no special meaning
to the operating system (except in Spartados). To run most files, at
the DOS 2.5 menu you type "L" and then the file name. Some files
might need the Basic ROM to be enabled or disabled. Read the emulator
instructions to find how to do that.

FWIW: I heard the reason you see so much work place violence in the US Post Office is because of the autocratic way each branch is set up. Like a lot of little fiefdoms.

In my experience, Fidonet was much like that and that had more to do with dooming it then technical issues.

For instance, in order to get the Atari echo you had to ask the local Fido boards sysop to carry it until you found one that would. Just because they started carrying it was no guarantee they would continue, I had the rug pulled out from underneath me more then once.

The internet is known to be one of the most contentious forums you participate in, it has NOTHING on Fidonet. Between the moderators and cliques on that system, well the Post Office still holds a good comparison. I never found it to be a friendly place.

For example, a new poster to this newsgroup is often greeted with "welcome aboard" or other such expression of emotion. My experience on Fidonet was more like "Who the hell do you think you are?"

Fidonet also provided nothing over internet access as far as cost is concerned. My initial access to the internet was provided by one of BAAUG's members Mike Sherwin. He ran a Waffle board, added the Atari newsgroups at my request, and was a local call. Of course I now get dinged for $26/month, but that is my choice for a commercial provider vs. local Waffle board.

Really, that is about it. I found Fidonet and specifically the Atari 8 echo to have a lot of unfriendly people in a clique and not a lot of valuable information. I found the c.s.a.8 to be superior in both technical knowledge and acceptance of new arrivals.

The delays like Larry talks about were not an issue, the old Waffle boards operated exactly like the BBSs in that that only allowed 30-60 minutes of access a day. I never got a reply or sent a message that was received in less then a day or two cycle.

BTW: In case you think my comments <or Larry's> about the nature of Fidonet are out of line, I have heard that the originator of the system went to one of the governing meetings and blasted the admins for some of the same reasons. The report I read said he used adjectives like "disgusted".

6600. Re: HELP - converting Atari disks to ATR

Newsgroup: comp.sys.atari.8bit

Source record: 33223

Well,
fortunately I did not use any of these british menus (alpha, multi,
howfen, etc.) regularly. just experimented a little with them. thats
what I found out so far:
- they are not at all DOS (2,3,4,Xe or sparta or something) compatible
- thus they do not have a regular directory
- mostly they try to use ultraspeed, warpspeed or highspeed
- there are not so many converter programs avaiable to convert to DOS 2
format
(as of yet, there is none for Howfen DOS!)

Ok, when converting them to ATR image this works fine with Ape or
SIO2PC, but only converting (uploading to the PC). Trying to boot any of
these ATRs failed, i.e. the computer hanged up after a few seconds.
Think this has to do with the changed SIO routine (ultraspeed, warpspeed
or highspeed), which most of the emulators do not like. tested it with
SIO2PC and all those british menus (images) did not work alright,
although they did not have any copy protection nor were they defective
(they work on the real machine but not on the emulator!) . Another quite
unusual effect is that Ape and SIO2PC support a higher SIO speed rate
and this works with most DOS or Gamedos versions, but not with those
british menus...

But afaik, most of those british menus contain only pirated software, so
maybe it is a good thing, that they do not work with the emulators
(laughing)... to get serious again, maybe someone can write a converter
program to convert all these menus (their programs) to standard DOS 2
format. Then one can convert them to ATR without any further
problems... -Andreas.

P.S.: Also try Jindrich`s ACVT and ADIR PC programs, maybe they can
help...

As long as the file associations are set correctly, simply double
click on the XEX file (under windows file manager). This will launch
the Atari emulator, load the program, and away you go. You cannot
load an XEX file from within the emulator. In order to run files off
of your harddrive from within the emulator, you map the drives under
File->Hard Drives (assuming you have the newest version, which is
2.8). Then, from your emulated DOS, the drive letters are Hx: The
file types you can run are the ones a real Atari would load, such as
*.com, *.bas, etc.

Your comments got me thinking... I went back and looked over what I had done for other people and lo and behold I already made a alpha-load image fixer.

Anyone who needs it please e-mail me, it just fixes a few bytes in the boot loader.

I've seen XEX files before, I think it's just a play on EXE and it loads the
same. I'm thinking that they would only work on XL's though.
I've downloaded a few music demos that had that extension.

I've never done it that way. Under Atari800WIN, you set your Windows desktop
as H1: (hard drive one) under the hard disks menu. Boot up a good DOS like
MyDOS 4.5 , format a blank ATR , and copy from H1:file.xex,D2:file.xex

That used to be fairly common; LJK shifted the directory locations for
Letter Perfect and Data Perfect files and Print Shop did something
semi-similar.

Ken's .ATR utility recognizes this one after I relocated the directory and
VTOC sectors. It still cannot read the files until I fix the forward pointer
links.

Of course B&C is still around. Bruce & Cathy can be found at
http://www.myatari.com.

They moved the business out of Silicon Valley to El Dorado, CA (east of
Sacramento in the Sierra foothills) several years ago. They're strictly
mail order. The cost of running a retail store in Silicon Valley just cost
way too much and it was either change or go out of business.

Thanks Steve! I've tried the "setauto.850" program to generate an autorun.sys file to load the APE R: handler. Now, when I run FOREM2.6M it at least doesn't say "Atari is not ready to accept connections...." However, I expect that there is a different problem here.

When I tried running Carina 1.0 (will try Carine 2.6 when I get a chance), I can connect with Telnet, but I have to type "RING", and then "CONNECT 2400", and then the BBS starts up. I may have to do the same with FOREM. Dunno.

I'll try the RS232.com as well.

Thanks,
Chris

6612. Getting back my old 800XL - Do I stand a chance of making it work?

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-09 23:20:22 UTC
From: John McCulloch <mcculloch@accesstoledo.com>
Message-ID: <9shobo0nn9@enews4.newsguy.com>
Source record: 33237

I'm getting back my old 800XL with RamRod XL & 256K RAM (if I remember right) and my old Indus GT. My old dual drive Amdek has failed so I won't be getting that back. It has been with the guy I sold it to for over ten years and I'm worried that all of the software may be unreadable by the Indus. To get the RamRod to work well, DOS XL was out and had to use other DOSes, of which I had several and hopefully will be getting it all back.

My best software, Basic XL, Mac 65 and Action! were on cartridge so I expect they will work fine, but it's all irrelevant if none of the DOS disks will boot. Some questions for a good soul that will forgive me for selling this stuff in the first place and help me:

1) If my Indus GT still works, can I format high density floppies at single or double density on it? I've heard that you need old DD disks.

2) Can I still get MYDOS or SpartaDOS or some DOS that will use the extra RAM banks of the RamRod XL?

3) I hear of APE and SIO2PC and might like to make use of one of them if I can get the hardware. However, my PC has WinXP and the disks are formatted NTFS. DO I stand a chance in getting either to work?

Thanks to anyone who can answer any of this,
John McCulloch

In the beginning, FIDO was very progressive. There was a reason for the many requirements and rules. It made sense at the time. But as time went on the world changed, but FIDO didn't. Or at least, it changed very little. It seemed to attract individuals that had a megalomaniac personality. Some actually seemed to be harsh dictators, but others were more benign.

Personally, I always liked the ATARI echo. But then, I like just about anything that has something to do with the A8.

I'm probably wrong on this, but if you have the Happy software version 7 or higher- it's for the 1050. That's the version I have that matches my Happy 1050.

>
> 1) If my Indus GT still works, can I format high density floppies at
> single or double density on it? I've heard that you need old DD disks.

The Indus GT can format disks in any of the 3 'normal' Atari
formats, Single, Enhanced or Double density. You cant use PC disks
that are marked High Density, you need Double Density disks. These
are hard but not impossible to find.

> 2) Can I still get MYDOS or SpartaDOS or some DOS that will use the extra
> RAM banks of the RamRod XL?

Yes you can download any of these. You will need some cables to
transfer them to regular disks if you dont have a modem setup.

Go to www.atarimax.com and click on the pooldisk link, you will
find the various dos system disks in there for download.

> 3) I hear of APE and SIO2PC and might like to make use of one of them if
> I can get the hardware. However, my PC has WinXP and the disks are
> formatted NTFS. DO I stand a chance in getting either to work?

You will have to make a dos system disk and boot that, then use
the DOS version of either program. The Win'98 version of APE wont run
at all on Windows XP.

Well if the drive works, you must have installed the upgrade
correctly. Are you sure its a Happy board? There were a number
of other upgrades, the Archiver and its various clones come to mind.

> I'll try the RS232.com as well.

Chris,

I recently updated APE to work better with BASIC BBS programs. I
was sending the RING/CONNECT messages to the Atari a little too quick
for a program written in BASIC to see them.

Drop me an e-mail and I'll get you the newest version. If Forem
has a module to use hardware handshaking (CD/DTR) instead of looking for
connection status messages that will work even better.

FamilyNet Newsgate

I am pleased to announce that the website devoted to all things Spectre GCR has been updated, and will receive further updates and additions as the weekend progresses (for it is a holiday weekend!).

You can find this site at...

http://www.geocities.com/clu-da-bard/spectre.html

New additions would include:

* More files and Spectre adds that were added to the download section
* More links to other Spectre references.
* Basic cleanup of the website in general.
* More links to other classic Mac clubs and sites.
* Added a software review section to say what files and OS's work and not and how well.

The Spectre GCR site would love to hear from any one with Spectre GCR experience on items not already covered on this weeksite (and that, I realize, could leave a lot open.. but we're trying to be thorough..)

Come check it out.. me know what you think!

Excellent point about the subject lines of a lot of posts. AutoDesk
(the AutoCAD people) gets more posts in a day than this group does in a
month, and so many times the subject line has absolutely nothing to do
with the topic of the message.

John Torton wrote

: Somebody knows if exist any virus for the Atari i never heard about

Technically, it is possible to write a virus for the 8-bitter without too much effort by changing the SIO routines in memory. It'll not be very effective if you don't have a harddisk, but several o.s' allow one to do a reboot without having to shut down the power of the computer so the banked memory (as in the 130XE) will not be erased at reboot, so the virus-code could be stored over there.

A virus could be made, but I don't see a reason for it (as for every virus :-)). I know however how to code a very effective trojan for people who use an emulator that will be loaded from an ATR image into the emulated memory of the emulator. I tested it and it works very effective :-) When loaded on an original Atari system you won't notice a thing. No, I won't give details...

: You wouldn't happen to remember a quicky schematic for that in/out on the
: 1010 would you?

Never made a schematic for it since it basically consist of connecting some wires directly to the tapeheads of the 1010 (with use of some resistors to get a "normalized" signal).

: I'm still making CAS files of my tapes and if I could record
: directly off of the recorder with my laptop while it's loading, it would
: make a much cleaner recording than recording off of a standard tape deck.

Usually the audio-quality of an audio tapedeck is better, compared to the 1010, but if you're looking for a very simple way to get clean data you may use a CD2Tape adapter for this. It's a cassettetape with a wire on it with a jackplug. The official use of it is to put the "tape" into a car-cassetteplayer and connect the jackplug to a portable CD. This way you can play CD's thru your car-cassetteplayer.

The same device can be used the other way around. Start-up a copier on your Atari, load the tape (or diskfile) into memory, insert the cd2Cas "tape", press Play&Record on the 1010, connect the jackplug to the laptop and save the Atari program to tape. Data will flow straight into your PC system. Signal may be a bit low, but normalizing afterwards on your laptop will do.

Adir does extract Jon.W, Rob.C & Howfen menus. To the PeeCee files, of course (not a problem to copy them back to a dos2 disk using emulator).

The other menus:
1) use plain dos files
2) I don't have creator utilities for them. So if somebody has them, feel free to send me them. I'll add them to ADIR.

Has anybody here played LASERMANIA? All of the versions I've come across and tried, won't let me finish the first level.
I complete the level, the door to the 2nd level opens, but... I can't enter it.

Anybody has a version that will let me cross to the next level?

Hey Fox, great idea!
I actually have a couple of those adapters lying around, later I'll try it out. I also have a couple of dead 410's I might just permanently wire up for tape copying. The problem I've run into with audio players/recorders is that all of the ones I have add a slight reverb to the output, I guess to make a fuller sound on a little speaker. I discovered this in my TRS-80 tape transfering when I examined the wave files with Cooledit the difference was as clear as night and day.
Thanks for the advice,
Mo

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

So, the next time we find a Trojan, we look at you? Should somebody alert McAffee and Symantec?
Nope, there are already too many Trojans, worms, viruses out there. How's a guy to gain any notoriety with all that competition?

(JUST KIDDING!)

Somebody else talked about an Atari 8-bit virus, and if I remember, I'll ask him about it the next time I see him.

Take care.

Source record: 33029

Recently i've got back into the retro groove and one of my first purchases was an Atari 800xl, 1050 disc drive and xc12 Datasette. The 800xl was teh first computer I ever owned but could never afford the 1050 - this one I obtained at the cracking price of £65 gbp including the 800xl. .

I have a cd full of disc images that I would like to 'plop' on 5.25" floppy so I ordered a sio2pc lead from j131 in Poland (very courteous btw - well recommended) who has confirmed that the lead is on its way. Basically, what I am wanting to know is what is the procedure for doing this and is it easy?

Hi,

> In the beginning, FIDO was very progressive. There was a reason
>for the many requirements and rules....
>....It seemed to attract individuals that had a megalomaniac
>personality....

Tell me about it, I ran a mail only node for several years (serving "point" users). I shut down and left Fido mainly because of the constant politics and wrangling which was ruining the hobby for many of us.

In fact, I was part of a number of networks, including SFNet, TrekNet, IncarNET amongst others. Fido was by far the most oppressive, with all too many of the region 2 controllers/coordinators acting like petty little despots!

More than anything I think that attitude is what has ultimately destroyed FidoNET. And quite frankly it serves them right. :-(

> Personally, I always liked the ATARI echo....

That was one of my hangouts too, along with the "OBSOLETE" echo.

Sadly, the last time I took a look at the list of echoes (about 18 months back) it had gone, along with many of the other echoes I used to frequent. :-(

In fact, I had a devil of a time finding any Fido BBSs in my area. According to the nodelist I grabbed then, my old net (2503? I forget....it was created when net 253 was deemed too large and split up - AGAINST the wishes of the majority of the sysops affected) had all but died. Hardly surprising since the guy who took over the running of the newly created net, erstwhile sysop of the "Magic Castle", hadn't got a clue how to run his own system, let alone an entire net!

Typical of the Fido I'd grown to know and detest....

I've gotten both of my cables from him and he is a very good person to deal with. You can use the SIO2PC to connect your 8bit to a PC and use the PC to emulate the disk drive (actually a bunch of disk drives). You need something like APE on the PC if you do a search you can find it probably at www.ape.com I can't remember, I'm sure Mr. Tucker will let you know for sure. For ATR to Floppy writes I mainly use the 1050 to PC cable made by the same person, it allows you to hook a 1050 up to your PC and do disk dumps. It will also allow you to archive your real disks into ATR or PRO images for copyprotected disks. I haven't found a protected disk yet that wouldn't dump successfully. You'd use the same APE software for that as well. I've had alot of luck using the DOS version.

Hi Andreas,

> Ok, when converting them to ATR image this works fine with Ape
>or SIO2PC, but only converting (uploading to the PC). Trying to
>boot any of these ATRs failed, i.e. the computer hanged up after
>a few seconds....

Which Atari system were you emulating? I have a vague recollection that some of these loaders used illegal OS ROM calls and therefore wouldn't work on XL/XE series machines - at least not until updated versions were released.

>....Think this has to do with the changed SIO routine (ultraspeed,
>warpspeed or highspeed), which most of the emulators do not like....

Can't comment on that, but I'm pretty sure that in the case of the early versions of "MultiBoot" they were calling the routine which prints a line of text to the screen directly (the same truly _stupid_ mistake an awful lot of programmers made).

>....maybe someone can write a converter program to convert all these
>menus (their programs) to standard DOS 2 format....

I don't see why, MultiBoot was a particularly useful menu system - the VAST majority of my old discs are in that format.

If the emulator(s) cannot cope with MB then it's the emulator which is at fault and it is the emulator which should be corrected; after all, if the software runs on a real machine then the emulator simply isn't doing it's job properly if it won't run that software, IMHO!

TTFN - Pete.

Message-ID: <5BYH7.36568$hZ.3399142@newsread2.prod.itd.earthlink.net>
Source record: 33032

Very easy. Just connect the XL to the 1050 set as D1: and daisy chain to the CD system thru the cable. Boot your favorite DOS (I prefer MyDos so you can force all sectors to copy when not a good VTOC present.) or load a sector copier. Start the SIO2PC software and load a disk image from the CD as D2: in case you have 2.0 or 2.5 and then duplicate from D2: to D1: ... voila.

Didn't try the adapter thing myself, but I don't see a reason why it shouldn't
work.

: tape copying. The problem I've run into with audio players/recorders is that
: all of the ones I have add a slight reverb to the output

This is normal for old tapes. Tapes are magnetic media. When the tape is not
used for a long time, it "copies" the audio/data from one part of the tape to
the overlaying and underlaying parts. Like carbon paper, but then magnetic
:-)

Many thanks to both who replied, the unfortunate thing is Mo, buying all teh stuff i've took delivery of has ermm, left me destitute so a 1050 2 PC cable is out of my reach for the next few weeks.

I would never have honestly though of doing it the method you mentioned Ron, sounds simple (nothing beats playing the old greats like Fort Apocolypse, Chop Suey and the like on teh real thing - somehow emulation just doesn't cut it!)

Hopefully my lead will be with me soon and I can relive my youth ;o)

My Microleague Box Score Stat compiler disk has died on me. I ordered a new copy from B&C, but they called me back to tell me that they have sold out. I have searched every archive I could think of, but have had no luck so far. Anyone know where to get a copy or have one they'd be willing to sell.

Thanks!

Pete

6671. Alternative Party: Atari 8 bits, ST, Amiga, C64 etc.

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-13 18:17:47 UTC
From: Kristoffer Lawson <setok@fishpool.com>
Message-ID: <9sro4b$965$1@news.bbnetworks.net>
Source record: 33045

We are organising what we believe is one of the best computer parties around, dubbed The Alternative Party. Basically it's about collecting a wide variety of alternative demo platforms together into an event for people who love machines with personality, and who are trying to create demos with them. Previously we've seen Atari Falcons, Amigas, C64s, a Vectrex, a Commodore PET, a Telmac, Spectrums, UNIX workstations etc. etc. We are also combining all of this with experimental and alternative art. Some artists who will be playing live at the 3-day event: Pnmf!, Tero Mi¿½yri¿½nen (plays live music with synths and a C64), Telamurska, Happo, Analogia, No I Aint.

It will take place in Helsinki, Finland from the 11th of January to the 13th. For more information contact me or visit the website, http://www.altparty.org/ (you can get an Atari Falcon invitro from there).

In addition, we've set up an area for collecting together information about cool machines and interesting art, or the "Alternative Wiki". Absolutely anybody can contribute information to it by clicking "Edit Text" at the bottom of any page, and add new pages freely. If there are people here who would like to contribute, please do! The Alternative Wiki can be found at http://www.altparty.org/wiki/.

Message-ID: <4it2vtks9grppesqposaba2tp4rlm4rfs7@4ax.com>
Source record: 33046

Hi,

I have a question about creating programs with CC65:

If you wish to create custom DLs and utilize P/M graphics is the best way to locate these by moving memtop down and 'reserving' memory for them just as you might in BASIC?

I'm new to cc65 (but old with Atari 8-bits) and all my C programming is with gcc and the PC. Manually using memory is not quite what I've been accustomed to.

Also does anybody know the memory usage of a cc65 program? What is still available for me in the way of memory?

Thanks for any help!

>

I am new to cc65 programming as well, but I have been messing around
with setting up DLs. It is possible to malloc() a location for it. I
have
some programs that use the following:

```
display_list = (unsigned char *) malloc(((192 - scanlines)/scanlines)
+16);
/* Write the display list to mem here... */

display_list[count++] = blah;
display_list[count++] = blah;
display_list[count++] = etc;

reg = (unsigned char *) 0x0230;
*reg = (unsigned char) ((int)display_list) & 0xff;
reg = (unsigned char *) 0x0231;
*reg = (unsigned char) (((int)display_list)>>8) & 0xff;
```

There is some other magic that goes on, but it is possible to malloc
both the
display list memory and the screen memory as long as you align things
properly.

Yea, but how do you align things properly? DLs can't cross a 1k
boundary (without special design and how do you set this up?) , and
P/M graphics a 2k boundary right?

I was hoping to create a generic function to setup a display list, and
P/M graphics, but I am just trying to fathom how you go about doing
this in C.

> this in C.

Ah, I see. I have a function in which you send it the
antic number and it sets up a DL for full screen mode
(ie, you cannot mix modes at the moment). It also
returns a pointer to the screen data (also malloc'ed
in the function).

It takes into account the 4K limitation of the screen
data, but not the 1K boundary of the DL. The DLs that
I am using right now are at most 207 bytes long. I guess
I have just never run into the case where it crossed a 1K
boundary.

You can cross a 1K boundary, if you know where it is ahead
of time, and since you know the malloc address, you do.
You just need to insert a JMP instruction before the
1K boundary. I haven't added this to my code yet, but I
plan on testing it soon.

I can send you the code I have if you like. I am in the
process of writing a game all in C. (Hopefully, it won't
be too slow :) Any help would be good anyway....
especially, if you start writing some functions and are
willing to pass them along.

L8r,

I'd like to make a function that you can pass a display list (without
the LMS and return addresses) and the function does everything it
needs to set it up properly.

Your function sounds like a useful function too!

I'd love to see the code, I've had zero experience programming on the
Atari beyond some very basic BASIC.

With the linker configuration file you can define a block of memory to be at
a
particular memory boundry (any power of two I think) and have the linker
define a symbol that points to it that you should be able to access via
extern
from the assembler. This requires one to create a linker config file vs.
using
a built in atari one.

In the segments section of the linker config file if you added:
ALIGNED: load = RAM, type = bss align=256, define=yes

This will define a global assembler symbol __ALIGNED__
which I think would be accessable to the c compiler using
extern char _ALIGNED__[whateverSize];
But I would need to test it since I mostly have only
have used the assembler with linker config files.

With the assembler you could also just create a file with
some byte statements and have the linker locate it at the
appropriate boundary but I am not sure how to do that
with the C compiler.

Message-ID: <9158DC624CTHEnterprises@205.212.123.11>
Source record: 33054

The program stack used by CC65 compiled programs is held in high memory. It is pointed to by the stack pointer as 0x80. The technique I would use would be to store your DL and PMs in lower memory, and give your compiled program a target address above that. Here's an example on how to do this with the JRD version of cc65-

First in cc65:

```
#include <stdio.h>

extern char dl[];

#asm
_dl = $2400
#endasm

char dl_header[]={0x40,0x40,0x40,0x02,0x02,0x00};
main()
{

strcpy(dl,dl_header);
}
```

This gets compiled to:

```
_dl = $2400
_dl_header:
.byte 64
.byte 64
.byte 64
.byte 2
.byte 2
.byte 0
_main:
jsr enterfun
ldax #_dl
jsr pushax
ldax #_dl_header
jsr pushax
ldy #2
jsr _strcpy
jmp exitfun
.globl _strcpy
.globl _main
.globl _dl_header
.globl _dl
.globl _errno
```

```
.globl _stderr
.globl _stdout
.globl _stdin
```

Then you would link with the -B parameter and specify the target start address of your program to be above the memory you want to use for the DL.

The problem with the ANTIC JMP is that it costs one scan line,
i.e. you would see one blank line on screen.

There's another solution, though: Allocate more memory! If
you need to hold a DLIST of n bytes, allocate n + 1K - 1 bytes,
and align the resulting memory pointer to the next upper 1K
border:

```
size_t dsize;
char *dlist;

dlist = malloc(dsize + 0x3ff);
dlist = (dlist + 0x3ff) & (~0x3ff);
```

This will align dlist to a 1K boundary, and you've no problems.

So long,
Thomas

FamilyNet Newsgate

I just got my scanner working and I am scanning in the Spectre GCR manual.
If no one replies in a week, let me know. ;)

The votes have been counted, and the full results of the 8-bit Minigame compo are here at last!

So, do we have a definitive answer to the question of which 8-bitter is best? Could this mean that we never need to resort to flamewars again? Of course not, don't be silly. But anyway, to see how all the entries fared, check out http://demo.raww.net/minigame/

And if you missed the competition, not to worry... download the game pack, and get down to some serious retro action. Just make sure you've got a couple of hours to spare...

On Tue, 13 Nov 2001 at 22:52:45 EST, CBClarke (cabell dot
clarkeNOSPAM at SPAMNOverizon dot net) scribbled:
->I was wondering if there was a driver I could use to get higher
->read speed (SIO 3x or even 2x) on the Indus?

In reply to which, on Wed, 14 Nov 2001 at 03:55:00 -0500, Steven
Tucker (classics at atarimax dot com) dribbled:
->DOS-XL includes the Syncromesh driver for the Indus.

The problem I found with using Synchromesh is that the usual
error-checking procedure that DOS programs use is dispensed with.
That's apparently how the faster speed is obtained. When I first
got Synchromesh I tried it out, but I quickly abandoned it when I
found that it resulted in a huge number of copying errors. (And
for an Indus user, ANY copying error is a rare event.)

Thus I think you're better off using regular DOS programs at
regular speed. Later on, you may regret having used Synchromesh
when you go to look at the files you thought you successfully copied,
but instead you find you can't use those files or even access them
because they're filled with error sectors. You'll discover that
months or years after the copying, and by then your original disks
will be long gone. At that point you'll have lost your data. Is
it worth taking that risk?

No need for a flamewar. The results are clear. Either there are
better coders on C64, more of them, the machine is better, or
all three are true. Ehm, or more C64 guys want to justify their
love. Just an amazing response, really, I'm impressed with the
entries from *all* the 8-bitters, but all these emulators...
my PC is confused about its identity and my hard drive is lying
about the space these files take up. And I had to dig out the
800XL and 1050. Freakin' contest. Now I have even less room to
move around in.

(shoot I can't remember everyone's names).
I totally agree with the person who says don't use high speed.
If you do use SpX high speed be sure to use the verify on.
AND then do a crc check of the files after you transfer.
I have a crc16 checker for A8 and PC.
Only then can you be sure your transfers were correct.

> been accustomed to.

Just use malloc() as you would do on a PC. A solution for an aligned block has already been posted, but there is additional trick that will make the unsed memory again available for the heap. Here is some sample code:

```
/* Declare the hadd library function */
extern void __fastcall__ hadd (void* mem, size_t size);

/* Allocate memory */
char* D = malloc (Count + 0x3FF);

/* Create an aligned memory pointer */
char* B = (char*) ((((unsigned) D) + 0x3FF) & ~0x3FF);

/* Add unused memory back to the heap */
unsigned LoFree = B - D;
unsigned HiFree = 0x3FF - LoFree;
hadd (D, LoFree);
hadd (B + Count, HiFree);
```

The only problem with this approach is that you cannot just free() the block B points to, because parts of it have already added to the free list. So if you want to free this block, you will also have to use hadd(). You may also loose a small amount of memory if one of both slices freed is less than 6 bytes in size, because the it will be ignored by hadd() in this case.

Regards

Uz

How about using frames? There may be a better
way, but without using dynamic page generation,
this is the only way I can think of.

If you want, I can send you a simple example.

If your webserver has Server Side Includes (SSIs) enabled, you could do
something like:

<!--#include file="somefile.txt"-->

Your HTML document may need to be renamed, eg, "index.shtml" or "index.shtm"...

Or, if your webserver has PHP enabled, you could do a similar command:

<?php include("somefile.txt"); ?>

Your HTML document mayu need to be renamed, eg, "index.php" or "index.php3"
or "index.phtml" or...

But is there a high speed driver for the Indus that is compatible
with the disk-based versions of Spartados? I have looked many times over
the years and never found one. The lack of an Indus high speed driver was
my only disappointment with Spartados. A friend of mine had one that
"sorta" worked, but it was not compatible with the 64K RAM track buffer.
I know that the Sparta X cartridge has one built in. Could it be
extracted to work with the disk-based versions?

Source record: 33095

Hello all! I d/l'd Atasm for the 8bit along with Xformer, the 8bit
emulator. Atasm is a MAC/65 compatible assembler that allows you to asm
6502 code for the Atari 400/800, etc. Very Nice! I shudder to think what
would happen if we all did this, lol! Atari rulz...

As for 8bit docs goto
http://pmwww.cs.vu.nl/home/ipoorten/Atari.8bit.Homepage/texts/reference.manu
la

Here is a short list for programming for the Atari 8bits:
(all hypertext)
http://www.umich.edu/~archive/atari/8bit/Diskutils/Transfer/
and get imu14.zip for .XFD<=>IBM disks

http://www.umich.edu/~archive/atari/8bit/Languages/Assembly/
and get atasm90.zip for MAC/65 compatible asm-ing for editing/assembling
6502 code on IBM

http://www.emulators.com/xformer.htm
for the Xformer emulator/licenced DOS 2.5, etc. all ready-to-run!!!

However, I wonder just how the REAL Atari Users feel about all of this
legitimate stuff that we can now get to run/assemble/write real 8bit
programs??? Any thoughts???

Message-ID: <3bf52ed6$0$35619$1dc6e903@news.corecomm.net>
Source record: 33162

I think the 1050 will work with the 800.
Why Baiz says it didn't work with his 400 I don't know.
(he says it works with an 810, so it must be a 64k 400.)
The only thing I can think of is the autoload disks trying
to use are somehow using RAM under the OS, like
SpartaDOS or Turbo BASIC. SpartaDOS will not
work on an 800, but it informs you so when you try
to boot it.
I mean, why wouldn't a 1050 work with a 800?
Russg

6724. Atari 800 and 1050

Hi Guys,
Just wondering if it's possible to use the Atari 800 and the 1050 disk drive? I've several autoload/boot disks which work fine on my 65xe and 130xe but using them with the 800 and the 1050 don't seem to do the job.

Also are the disk commands the same on the 800 as the XL series?

Cheers,
Richard

The Syncromesh driver for the Indus actually reprograms the Indus.
I'm not sure it even applies a patch to DOS-XL, the support may be
built in.

The question now is does Spartados support talking to the
Syncromech Indus at high speed, and I believe that the answer
to that is NO unless your using spartados X.

Since your basically downloading new firmware into the
Indus (which then runs from its own internal RAM), you could
modify the Syncromesh code to be Spartados compatible.

I believe the Indus GT runs a Z80 processor. Hope someone
knows Z80 assembler cause I sure dont =]

The disk commands stayed the same except that the 1050 knows one additional
command (format enhanced density), so did the serial communication protocol.

So long,
Thomas

I do not think the two will work. I tried to get my 1050 to work with
my Atari 400 and it did not. Luckily I still have my 810 and a Percom
Data drive that do like my 400.

Like the previous poster indicated, you have a height and width set to
nothing. Here's what the HTML line looks like now:

Update it to this:

Also, your file for explaining on how to do the upgrade is being linked as a
image. You need to use a hyperlink so the person
reading the page can display the instructions. By doing what you did, it's
not being display because the browser doesn't know
what kind of graphic file a .UPG file is. Here's what the line looks like:

Make it into this:
Text file describing FlashROM upgrade."

"Turbo..." sounds like an XL/XE only app which might not function on the
400/800. 1050's, Ranas and Indus's do just fine on the original 8-bits, but
the DUP.SYS menu cannot load on a 16K 400 because of memory limitations.
Basic can boot DOS.SYS on the 16K 400 as long as you do not expect much in
the way of statement table space and display RAM size.

Hi Mathy;

The instructions are seen as a link to another page and displayed as raw text which is not properly formatted. I would recommend that you either make the .upg file a very simple .htm file so it will wrap in the browser window or pre-format it with some carriage returns to break up those lonnngg lines.

Just now at 18:34 Fri Nov 16 your page time, 3 images appeared on the site with IE5.

6744. SmartIDE upgrade

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-17 00:02:16 UTC
From: Shawn Jefferson <sjeffers@home.com>
Message-ID: <gp9bvts3a74klbcss71d22oso1rn384io2@4ax.com>
Source record: 33167

I was thinking about trying to do a SmartIDE upgrade on one of my
800Xls, or maybe the 1200XL, but since I am not too knowledgeable
about reading schematics I have some questions:

Here's the schematic:

http://www.redshift.com/~cdyson/mods/ide1.gif

What do the connections in the upper left hand corner go to? These
are labeled D1, D6, D7, OS, J/S, CSROM and two unlabeled.

Where is System Vcc (from the DS1210) hooked up to? The power supply
that you are supposed to install (at least in the 1200xl as per the
SmartIDE article?)

On the right side in the middle there are two gates that are not
connected to anything else (except ground.) Is that right? (I know
that those are two gates in the ICs, but I was expecting them to make
a connection to the rest of the circuit somehow.

Once you're done laughing, thanks for the help!

richard@eurographics.co.uk says...
> Hi Guys
> Humm, ok so the next question is should I keep the 1050 on my XL
> machines and get an 810 for the 800?

All Atari 8-bit computers and SIO peripherals interoperate
the same way, including the 400 and XEGS game system. If you
cant boot your 1050 on a 400, it may be because the 400 does
not have enough memory to accomidate the dos system or the
software on the disk your using.

An 810 does look nice next to an 800 though.

Steve

>But is there a high speed driver for the Indus that is compatible with the disk-based versions of Spartados? <

I could be wrong, but I am pretty sure that there was a driver at Draco's web site that was for the disk-based Sparta. I downloaded it, but have not been able to locate it, yet. Of course, I'm not a Sparta user, so I never even tried out the download. I don't think that site is still up. Perhaps someone else remembers this?

Well, according to the instructions in the accompanying article:

Dl U18 pin 14
D6 U18 pin9
D6 U18 pin 7
OS right side of W12 (remove W12 jumper)
CSROM left side of W12
J/S right side of R62 (below cart, port)

I guess the second "D6" really means "D7"...

The other two are probably unused...

>Where is System Vcc (from the DS1210) hooked up to? The power supply
>that you are supposed to install (at least in the 1200xl as per the
>SmartIDE article?)
>
Not really sure about that one... probably yes.
Or then, maybe that pin is what PROVIDES the Vcc to the rest of the chips
on the board (you'll notice there are no indications of where the Vcc and
ground pins of all the chips are to be connected to...) Let me see:

DS1210
Nonvolatile SRAM controller chip.
TOL selects power-fail VCC level, based on 5% tolerance when 0 or
10% tolerance when 1.

```
+----------+ +------------+
VCCo |1 +--+ 8| VCC |/EN|VCC |/Y |
VBAT1 |2 DS 7| VBAT2 |---+----+---|
TOL |3 1210 6| /Y | 1 | OK | 1 |
GND |4 5| /EN | 0 | OK | 0 |
+----------+ | X | LO | 1 |
```

+------------+

[This information is part of the GIICM]

Looks like you should connect the Vcc source to pin 8 of it and it will
provide in turn the "right" Vcc for U6...

>On the right side in the middle there are two gates that are not
>connected to anything else (except ground.) Is that right? (I know
>that those are two gates in the ICs, but I was expecting them to make
>a connection to the rest of the circuit somehow.
>
Those are just unused gates, I'd say, you connect the inputs to ground to
prevent them from being damaged by static...

>Once you're done laughing, thanks for the help!

Sorry, still laughing...
(not really)

Message-ID: <9t5nsp$g2v7$1@ID-60478.news.dfncis.de>
Source record: 33176

I used the MW II for a long time, before I got a 130XE. It's always activated when BASIC is plugged in. Actually, you never want to have it plugged in with any other cart, although I managed to get into the disassembler with my Pacman cart plugged in (got a nice dump of the code, too).

MW II was a major help with things like auto line numbering and renumbering (something that TurboBasic eliminated the need for), and the Machine Language Monitor was helpful when trying to copy multi-stage tapes (Zaxxon).

It was a cool tool to have for the 800, but the 130XE and TurboBasic loaded into ramdisk quickly became my preferred setup. Every now & then I'll drag out the 800 & MW II to play with, but it really has fallen by the wayside for me.

One of these days when I can dig the manual out of storage, I'll scan it. I know there've been some requests for it, but I don't know if anyone has done it yet.

Finally got my site up. I had to rush a bit to meet a dead line so I only put up the graphics mode outline in the BASIC tutorials section.

http://www.sheridanc.on.ca/~ruminski/enterance.html

I should have about 8 more reviews up within a week or so after I get chance to capture more games on video. Warning to all Netscape 4 users that I dosn't work in Nav 4 but it will work in Nav 6 (good enough reason to upgrade to 6 :)

I just got in 5 extra PCs with 51/4 floppys so as soon as I get one out of them working I will begin extracting code (first to be extracted will be mountain king)

> CU Mathy van Nisselroy

Since you want the text section to be part of the index.htm file, the easiest way is just to modify that file each time you make changes and then upload it. Keep a bunch of blank lines before and after the text section to find it easily. You will only have to upload this one file anytime you change it. The only other way is with frames or scripting.

If you have a homepage with an index.html file you can't change (it requires a site homepage manager), then make it only point to your real homepage, index.htm or homepage.htm, etc. This is the file you'd change and upload as needed. (<META HTTP-EQUIV="refresh" CONTENT="1; URL=homepage.htm">)

But you will probably need to add a button that lets the user go there if the auto refresh doesn't work.

: Hello all! I d/l'd Atasm for the 8bit along with Xformer, the 8bit
: emulator. Atasm is a MAC/65 compatible assembler that allows you to asm
: 6502 code for the Atari 400/800, etc. Very Nice! I shudder to think what
: would happen if we all did this, lol! Atari rulz...

: However, I wonder just how the REAL Atari Users feel about all of this
: legitimate stuff that we can now get to run/assemble/write real 8bit
: programs??? Any thoughts???

I don't take the people who are using an emulator too seriously. They say
"it's great" and things about "nostalgic reasons". What's nostalgic about a
proggie running on an expensive Pentium or what??? Some of those people even
think they're supporting Atari 8-bit this way, or are an 8-bit user. Well,
that's life I guess...

From: NoOne@FakeEmail.com
Message-ID: <3bf82fe3.423273@news.bright.net>
Source record: 33100

I used to kind of feel that way. I once posted a message on here and actually suggested that we split this newsgroup in to two. One for "REAL" 8-bit users and the other for the emulator users. That was back in 1996 or so, I don't remember now. Back then I suppose I was irratated at the chatter about emulators and such. I also suppose a "REAL" purist would insist on using only "REAL" Atari Corp equipment. An Atari 850 interface, an Atari SX or acoustic modem, an Atari BBS network. If that's what floats your boat then more power to you. But even back then I was hanging all kinds of non-Atari peripheral equipment off of my XL.

As far as using PC tools to develop Atari 8-bit programs, I'm all for it if you've got the tools. SDX was developed with MAD MAC (and/or XASM) on a PC. Many BBS Express! Professional C modules were cross compiled using Keith's C65. I think that the BBS core itself has been cross assembled using Keith's XASM ever since 5.0. Even the original Atari 8-bit o.s. was cross assembled on another computer. My unzip utility was done with ATASM and my ATOS was done with ATASM and the JRD version of the CC65 cross compiler.

So if your focus is to be productive in developing 8-bit software then sometimes the PC tools and emulators might help. Or for a quick A8 game without all the desktop clutter. But if it's the unique Atari 8-bit magic that you are after, there's just no substitute for a "REAL" Atari 8-bit keyboard.

What you offer for $10 or even higher prices is available for $3 or less at populated online-auctions, so I think your "shop" sucks... I wouldn't wonder if you buy your stuff at online-auctions and sell it overpriced to newsgroups-newbies who follow your annoying ads in this actually non-commercial newsgroup.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

Message-ID: <9taunu$60d$1@nets3.rz.RWTH-Aachen.DE>
Source record: 33113

Howdy folks

I have got the datasheets to the NS405, the main chip in the XEP80, at home. I scanned the first page last week and found out the space I have on my site is way to little. So now I'm looking for somebody who's willing to put them up after I scan them. It's 38 sheets of paper, each (except the last one) showing two pages from a book. The NS405 is capable of handling 64k x 8 or even 16 bits. And can even do color. Schematics using blackboxes -----CPU------multiplexor-----switch-----(just an example to show you what kind of schematic. As you can see, no capacitors and resistors and stuff like that. I think they are called Blokck schematics)) are included.

CU Mathy van Nisselroy

Does anyone know the name of this arcade game. It looked very much like the Space Eggs game from Sirius for the 8bit.

Thanks,
Dan

Hi Fox-1

IIRC that was a mod for the ST allowing execution of Mac software... The
comment inadvertantly slipped into our realm.

Well,
the same counts for me. I only read, that there has been some sort of virus (which destroys the 3 disk boot sectors) in a czech magazine (not the funny Paperweight! it was a different program). thats why Bewesoft (also a czech Atarian) coded this anti-virus program. As of yet, I have never seen this virus program nor had any trouble with viruses on the little atari. Hope this will continue in the future. You should not write programs (viruses) to destroy other peoples work. Especially not on the little Atari... -Andreas.

Source record: 33119

Well,
isn`t Lasermania one of that many proto carts ?!? Maybe it was never
finished and thats why you cannot reach level 2. I remember Nebulus,
called Tower toppler for the XL/XE. This one is also a proto, it crashes
completely after level 2 (allthough the game should have 8
levels/towers). You should be aware, that protos are not always finished
game carts and have some small or even big bugs. Otherwise they would
not be prototype carts... -Andreas.

Tomasz Cichon schrieb:

6798. Re: the ethics of atasm

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-19 19:54:17 UTC
From: Fox-1 <DONT_USE_fox-1@home.nl>
Message-ID: <CjdK7.9441$98.1533845@zwoll1.home.nl>
Source record: 33122

: >I don't take the people who are using an emulator too seriously.

Tom Hunt wrote:

: I used to kind of feel that way. I once posted a message on
: here and actually suggested that we split this newsgroup in to two.

Which would be o.k. for me.

: One for "REAL" 8-bit users and the other for the emulator users. That
: was back in 1996 or so, I don't remember now.

1997 IIRC :-)

: Back then I suppose I
: was irratated at the chatter about emulators and such. I also suppose
: a "REAL" purist would insist on using only "REAL" Atari Corp
: equipment.

Maybe I'm a bit of a purist, but I don't really hate emulators or such. I am a registered user of A.P.E. and use the "non-Atari-corp." Blackbox' and such, but things I don't like are questions like:

"where can I find ATR's to play games on my emulator"
"what is the best emulator around"
"why is game X not running on my emu"
"why does my emu not recognize my joypad"
"what Pentium do I need to run emu X"
etc, etc, etc...

I admit, there aren't that many messages anymore over here. Some time ago 75% of the post were about emulators. Like if a real Atari never existed. That's why I left csa8bit for a while...

: As far as using PC tools to develop Atari 8-bit programs, I'm
: all for it if you've got the tools. SDX was developed with MAD MAC
: (and/or XASM) on a PC. Many BBS Express! Professional C modules were
: cross compiled using Keith's C65. I think that the BBS core itself
: has been cross assembled using Keith's XASM ever since 5.0.

I run 5.0b, and I'm sure it's cross-assembled. There nothing wrong with developing software this way, as long as the result is o.k. Unfortunately, when looking at most of the modules provided with Pro! 5.0b the results are everything but good. There are modules in it (like "suspend.cmd" to name one) that are several kilobytes in size, while my own one is only a few bytes, and it performs better, and is written using MAC/65 on real Atari 8-bit...

I know one place I won't be buying from now. I'll be avoiding the BS for my non-auction needs...

For those looking for a reputable shop, I recommend B&C ComputerVisions at http://www.myatari.com. They've been around for years..back in the 80's when I lived in the SF Bay Area I not only bought from them but had them repair some hardware (my old 810, still in use today).

Stay away from the BS shoveled by spammers...at least check out someone who can afford his own domain name...

Paul

All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 11/20/2001

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site, including 52 for the Atari 8-bit computers!

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari 8-bit computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection list for this system is currently on-line!

I have the following Atari 8-bit software, hardware, and accessories
for sale or trade.

There are a few items that are listed as untested. When I bought
these items I was told that they all worked, but due to a lack of
time, I have been unable to test them myself.

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

Loose cartridges, no box or manual:
$ 2.00 Missile Command
$ 1.50 Space Invaders
$ 3.00 2-pack: Missile Command and Space Invaders

Box and manual only, no cartridge:
$ 2.00 Millipede

Manual only, no cartridge or box:
$ 1.00 Galaxian

Accessories:
$ 1.00 "A Note Regarding Software" letter: Atari Home Computers
-- some rips
$ 4.00 Atari 1010 Program Recorder Owner's Guide (16 pages)
$ 4.00 Atari 1200XL Home Computer Owner's Guide (20 pages)
$ 7.00 Atari 65XE Personal Computer Owner's Manual (138 pages)
$ 4.00 Atari 800XL Home Computer Owner's Guide (24 pages)
$ 4.00 Atari BASIC Reference Guide: For Experienced Programmers
(16 pages)
$ 2.50 Atari Home Computers: The Next Generation catalog
(32 pages)
$ 7.00 2-pack: Atari Disk Operating System Reference Manual:
DOS 3 (112 pages). Lot also includes An Introduction
to the Atari Disk Operating System: DOS 3 (32 pages)
$ 7.00 Inside Atari BASIC [Atari / Reston] (196 pages)

[Pictures of the items listed below will be available soon]

HARDWARE:

NOTE: The Lots listed below include only what is listed!

LOT #1

ATARI 1050 (127K) DISK DRIVE.

This disk drive does not include the power supply, or Molex
connector cable.

NOTE: Light comes on, and drive tries to read disk, but drive will
not boot up. Sold as non-working item, possibly repairable, for
parts only!

$ 2.00

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.95 for the first
game and $1.25 for each additional game. Shipping for hardware and
accessories depends on weight/distance. Large orders will be weighed
as a package, to reduce shipping costs. Foreign orders welcome.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for
something that isn't listed, please don't ask (because if I
had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and
systems have been tested and are in working order. I very

rarely sell items that aren't working, but if I do, they are
clearly labeled as such.

3) Trade offers, in particular for items that I need, will be
considered (especially if the trade offer overwhelms me). I
collect for over 50 different systems, so please feel free
to send me a trade list.

4) Buyer has seven (7) days to send payment, and pays all shipping
costs. Shipping cost depends on both the weight of the order
and the distance that the order must travel, unless a set
amount is already listed. No orders will be sent C.O.D. So
if you can't mail the payment within 7 days, please do NOT order!

5) Since items will be held specifically for you, if you aren't
serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly
listed. There is no minimum order.

7) If you have a problem with the listed price, please remember
that nobody is forcing you to buy from me. I have been in
business since 09/05/93, so I have a good idea how to price
items. My personal philosophy is that something is only worth
what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either Personal Check, money
order, Cashier's Check, cash or PayPal. Orders from outside the
U.S. are also accepted (postal money order, PayPal or cash only!)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your
order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in
(please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this
information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

Yeah www.ev1.net I think, they make a lot of claims but they've been a real disapointment for their customers. I couldn't sign up with them because I didn't want to use a credit card for payment. I'm sticking with Ma Bell for now (www.swbell.net) , they're lame in the webpage dept. but I like the net being on my phone bill. I'm still looking for webspace though, and I don't think I'm going to be able to post those big manuals until I find at least a couple of hundred megs for free (I've got a lot of other stuff I want to upload as well).

6809. 800xl power-on problem

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-20 13:04:02 UTC
From: switchblade <xxx@nospam.com>
Message-ID: <6xsK7.27462$nC.335664@news.easynews.com>
Source record: 33133

Having bought a 1050-2-PC and SIO-2-PC cable, and started transferring some of my disks across to the PC (although not the aplahload ones - they wont!). I have uncovered a problem with my 800xl...

It seems that it only wants to boot from disk when it gets warm?! More details...

Initial power on is ok, and it boots from disk. However if I power off, and try to boot from disk again, it may take 20 or more attempts (power off power on) until it will boot again. If it fails, it just sits there with a blue screen, cursor in the top left, doing nothing.

Any ideas?

6810. Re: Lasermania, the game.

Newsgroup: comp.sys.atari.8bit

How long did you power it off? Due to persistent RAM contents, the Os may
think that the power-off/on cycle was only a reset (it does so by checking
three memory cells in page 3). You should power it off for around 20secs, and
then it *should* work again.

So long,
Thomas

Hi,

> Initial power on is ok, and it boots from disk. However if I power
>off, and try to boot from disk again, it may take 20 or more attempts
>(power off power on) until it will boot again....

Hmm, that's actually quite normal behaviour for an (early model?) 800XL in my experience. My original machine had the same "problem".

I'm not sure exactly what causes it, some have said it has something to do with the RAM chips Atari used in these machines having a long data retention time (I don't really subscribe to this theory myself since we're talking dynamic memory).

Others have said it has something to do with a reservoir capacitor in the power input circuitry. Allegedly Atari chose such a large value for this capacitor that it held enough charge to keep the RAM and refresh circuitry going for some seconds after power off - albeit at a level where the RAM contents degraded rapidly, but slowly enough to cause real problems.

I tend to believe this one since I've known people who have changed this cap in their machine and cured the problem (though don't ask me which one, it's been too many years).

TTFN - Pete.

A Galaxians style shoot em up except your craft was split into 3 parts
which if you completed stages rewarded you with another part of your
ship docked on to increase the fire power.

If you died you went lost a part of the ship going from small head
part with single shot to the mega wide base part which was big and
slow with twin shot.

I assume you mean the same parallel bus port that is on the 800xl. Atari
made a few prototypes of an expansion box called the 1090xl. There was
a guy in England who sold 64k memory upgrades for the 600xl, which
plugged into that port. Also the MIO and Black Box interfaces can
be connected, but I'm not sure if they work on an unexpanded 600xl.

Atari itself made such a memory-expansion too: the Atari 1064.

600XL (and 800XL) have parallelbus, and cartridge-slot on top.
130XE has cartridge-slot on the back, together with a smaller expansion-bus.
Combining those two ports makes a parallel-bus as on the 600XL.

The Yorkie memory upgrade actually gave 256K; atari also sold the 1064 (think that was the number) that gave 64K. Best still has the PBI Experimenter's kit from MPP available; it gives some projects etc you can do with the PBI.

There are also tech docs from Atari floating around on the net (and somewhere on my hard drive!) which describe in detail the 1090xl, how interfaces work, memory mapping and other such issues. Had ICD or CSS respected the Atari design specs, it would have been possible to have multiple boxes daisy-chained onto the PBI, with just a jumper or switch changed. Unfortuantely, both devices are ill-behaved, occupying all the memory intended for devices.

Check out my site to see what a BlackBox looks like
http://www-users.rwth-aachen.de/mathy.van_nisselroy

If you wanna use a BlackBox or MIO, 16kB is not enough. Maybe for the
hardware, but.... Compare it to using a data recorder while using a 1Mb
memory upgrade. It just won't do.

6848. Atari 2600 & games recently featured on the collector show...

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-22 21:34:50 UTC
From: SoftNGui <softngui@earthlink.net>
Message-ID: <_beL7.2984$oF.324085@newsread2.prod.itd.earthlink.net>
Source record: 32971

Hi

I don't remember the name of the show, but its the one where they travel around and invite people to bring their junk and have experts give estimates on its value. The travelling road show, or something?

In Tuesday's show (in NY), someone brought an Atari 2600 and some games in different condition...some with real bad labels torn off, others in very good condition. The Atari 2600 appeared to be either the 4-switch or 6-switch wood grain model. Hard to tell cuz they didn't zoom in long enough to distinguish clearly and I wasn't taping it (actually, was surprised to see it on...was flipping channels at the time)

Anyway, their expert priced the game system alone at $100. And games for it between $5 and $10 for common games, and as much as $2000+ for really rare games that were given away as promotional items at trade shows (I believe one example of these games was some kool-aid game that was never in wide distribution but given away at industry shows by the owner-company as a gimmick)

Anyway, these estimates would have made me cough my milk through my nose if I had been drinking milk. Was this guy close in his estimates? I think he went way overboard...after all, I didn't see anything there but a good condition 2600 (no box, no manuals, not even a hint that it included joysticks or a simple combat game). I see stuff like that on sale on ebay for $5-$10 tops regularly.

> Mark
> MSmith@optonline.net

Mr. Atari in the Netherlands has made some excellent strides in the IDE interface department. He has built them for the XL, XE, and currently working on one for the Atari 800.

You can see the instructions at:

http://www.atari.myweb.nl/myide.htm

The XL/XE IDE information...

http://www.atari.myweb.nl/hardware.htm

... and the upcoming Atari 800 IDE interface at...

http://www.atari.myweb.nl/DrClusproject.htm

At least one fine example of the IDE interface for the 8-bit.

Howdy folks

If you've sent me email somewhere between thurstday last week (18th???) and this weeks wednesday (22th??) and you think I should have answered it but didn't please send it again.

I'm having problems here with my email. One of the guru's had a look at it and didn't really find an answer but he was gonna work on it. Result up till now, my non-deleted emails still disappear (as they have done since the new server is up) while my deleted emails (as of today) come back each time I log in. This seems to have something to do with where this stuff is saved. Unfortunately, even the guru didn't know why I can not change the location where my mail and configuration is saved. I only know the guru by face, not by name. And the SysAdmin who knows who this guru is, has gone home. :-(((

6857. 8 Bit IDE Interface

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-23 16:10:43 UTC
From: "Mark W. Smith" <MSmith@optonline.net>
Message-ID: <B823DF54.2E82%MSmith@optonline.net>
Source record: 32980

Can anyone tell me where the repository for information is for the Atari
8-bit Smart-IDE interface? I assume someone is collecting data on this.

Thanks,
Mark
MSmith@optonline.net

So you can format disks in ultra-speed sector skew. Even though a happy
drive doesn't need US skew to read at hi-speed, the 1050 doubler does.

6863. 800 XL TV Switch Box / RF converter

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-23 23:19:07 UTC
From: John McCulloch <mcculloch@accesstoledo.com>
Message-ID: <9tmlhd0u2h@enews2.newsguy.com>
Source record: 32986

I just got an 800XL with 256K and another Newell thing that has a little cable with switch on the end sticking out the back (don't remember what this is). I owned this unit many years ago, but there's no PS or TV cable. I can get a PS on ebay, but I can't find a TV cable/switch box. I need the whole thing from the "SWITCH BOX" port on the back of the 800XL to the TV. Don't remember how much is involved.

Anyone know where to get one of these? I do have an assembly that appears to connect to the single RCA type connector of the 800XL to a small box which in turn connects to a longer cable with the same kind of connector on the end. I suspect this may be part of the whole assembly I need, but it obviously won't connect to a TV. Needless to say, I got no docs back.

Also, I the 800XL with the good Newell stuff is worn and the keyboard has visible problems. Does any know if one can get 256K upgrades for the 800XL any more? I received a standard 800XL (of course, also with no PS or RF) which is in much better shape.

If the keyboard is ropey, why not just swap the keyboards. IIRC its just a ribbon cable that slots in.

The Newell thingamy is not something i remember having or using though. so can't help there. Y shaped tv aerial cable split boxes are still generaly avalible though for a couple of quid and work just as well.

Just ideas though.

A lot of comercial shops/sellers seem to way over-estimate
their prices.

A quick look at e-bay.co.uk and ebay.com also shows silly prices.

Taking a look at Yahoo auctions on the other hand seems far more resonable.

And there is always the pot luck of Carboot sales and charity shops (Flea
markets and thrift stores to our mates across the pond).

Sounds like Omnimon XL, switch should go to an add on board with an
EPROM on it.

Thank You! Omnimon XL sounds familiar now, just don't remember how to work it. This not really what I need in my working unit, it's the 256K (also Newell) upgrade. I still have no power supply of video cable. Once I can get one of each, I'll decide how to get one working system.
John McCulloch

Geez, Bill, you're losing your touch.

They look like GTIA 16-shade mode (Graphics 9). I guess the pictures are in
such low resolution because they don't look much better in higher res :)

Change two bytes, at $7C0A, to $1A $1A. If you're using Atari800Win, just
hit F8 and type: c 7c0a 1a 1a
and then "cont" to get back to the game.

If you are using a sector editor, search for the sequence:
A5 74 E9 01 85 74
(In assembly: LDA $74; SBC #$01; STA $74)
Replace the E9 01 with 1A 1A, which is two NOPs.

Well, I guessed as much (since the GIF screenshots were about 80 across),
but it's a shame to lose the verticle resolution. I wanna see 320x200
screenshots with nice, big long pixels. :)

Also, is the 9-color mode really just plain 'ol 9-color mode (aka
OS "GRAPHICS 10" mode in BASIC)?

And WHEN can we see a demo!? :) Anything!

The cable with box and 1/4 inch RCA plugs will deliver a 75 ohm signal. You
can either:
find a pin plug to F-type cable adapter for TV connect.
or any standard video game TV adapter
or replace one RCA plug with the F-type connector.

Thanks for the info! However, Atari800Win does not appear to have an editor
or machine language monitor. F8 controls the speed of the emulator. I am
using Atair800Win ver. 2.6c.

Time to upgrade. Atari800WinPlus 2.8 really is good, and in it F8 brings up
a runtime monitor.

You're right. I didn't check any charts, this is what A800Win assembles when
you ask for a NOP.

It seems that Atari800WinPlus will disassemble 1A, 3A, 5A, 7A, DA, EA and FA
as NOP. I assume the real 6502 does likewise, even though EA may be the
'official' code and the best one to use on real machines or other emulators.

Hey gang, just wanted to let you know about a ongoing project. We at JYBOLAC are working on bringing the wonder of the Dal-ACE disks online and make them available. As you'll see, we have only found a few out of the many disks that were out there, but we hope to somehow find more. Come check it out and check often. We'll try to get more up there at least weekly until we have added all the disks that we have found to date.

You can find this at:

http://www.geocities.com/doctor_clu/DALACE.html

Take care,

Greg Goodwin / Doctor Clu

Personally, I'd probably do it in a character mode, to simplify draws/redraws, especially since you're dealing with straight lines. Mind you, that would work best with a "Wolfenstein" type game that's only 2D (vice the 2 1/2 in Doom). Doing in in the 40x24 4 colour mode would also give you some flexibility in terms of player priorities (hide the enemies behind walls, show them through other places).

Using two players per enemy gives you two three-colour enemies onscreen at once without resorting to any twiddling; the missiles would still be available for shooting etc.

I just hope this isn't another "2600 DOOM" situation (look at http://www.geocities.com/TimesSquare/Arcade/8691/2600DOOM.HTM for more details on that)

David P.

Supposed to be an expansion to 64k and CP/M. I have seen neither of these.

Short story. Bought my first Indus when B&C had them on sale for $175. Next trip in to B&C I told Bruce ~"You know the DOS XL and spreadsheet software bundle that is shown on the box wasn't included in the package." To which he replied ~"These were returns from Mexico", "The software wasn't any good anyway." I think he recomended I switch to Top DOS.

I think the enemies are blitted just like the rest of the 3D graphics.
Probably not P/M Gfx. Of course, the authors would have the definitive
answer. :)

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

At least two manuals that came with the drive (see
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1300425728).
In addition, there are some technical manuals as recently auctioned by
Bob Klass on eBay.

From: Curt Vendel <cvendel@worldnet.att.net>
Message-ID: <2GNM7.12302$V9.1402245@news.direcpc.com>
Source record: 32833

Hi Krystian,

Its very difficult to find them as only a small handful were ever made,
I have a test unit which has the AMY chip but the only software I have is
the developers programs that were written for PC development.

The chip was designed by the Advanced Technologies Group at Atari in 1983
and was going to be used along with a new graphics chip called Rainbow in
Project "Gaza" a high end graphics/sound workstation. 2 such prototypes
were built and one was demo'd at the 1983 CES which performed a Opera in
both male and female voices.

When Atari was sold in 1984, the Tramiels attempted to wedge the AMY sound
chip into a 65XE (Atari 900XLF) and create the 65XEM, unfortunately they
fired the very team that developed the chip and with no money to invest in
getting the chip to work right (all funds were needed for the new ST line of
computers) they sold the chip to a company called Sight & Sound in
Milwaukee. S&S not only figured out how AMY worked but created a newer
and more powerful version, just as they were preparing to start selling this
new sound chip, Atari's lawyers swooped in with a vicious lawsuit which
must've been pretty damned frightening as the interviews I did with various
management and engineering staff at S&S were all done on an agreement of
anonimity still to this date. S&S was sold in 98' and the warehouse was
liquidated, fortunately some notes and software were saved.

There is only one other complete 65XEM out there which is owned by John
Hardie, he has most of the same developers software too. Another 65XEM is
owned by Chris Strong, but it is only a 65XEM case with what looks like a
proto for the XEGS inside (according to Chris).

If you want to learn more about the 65XEM, go to:

http://www.atari-history.com/computers/8bits/65xem.html

Source record: 32834

Hello folks,
here are even more good atari news from Poland. Take a look at:
http://uce.pl/ikplus/
to find screenshots and downloadable demo versions of International
Karate Plus. There are at least two demos for the A8 avaiable
(downloadable), one is called Falcon and is just a superb demo. Press
SPace or Shift to leave the scroller and see the main part!!
The other demo is called IKV006.COM and is the Beta-Version 006 of IK+.
Press -+=* to move the Karateka left or right and to see the different
attack options. (Attention: this beta-demo has of course many bugs and
is far from finished !! Keep this in mind !)
-Andreas.

6911. Atari Touch Tablet

Newsgroup: comp.sys.atari.8bit

Kurt et al,
Sorry to hear of the vaporosity of this item :-(. Have a one page
Atari Product Sheet for the 65XEM. Looks interesting and was hoping at
least a small run was produced. Why a 65XEM and not 130XEM? Extra
memory would certainly help music applications.

6914. Whatever happened to CompuTalk BBS (Dallas)?

It is the way 6502 emulators have to work for speed. I actually had some C
programmer who I can't remember off hand argue ~that gnu C was smarter then
me so I could not possibly know of a way it could be done better.

Anyway, C compilers check for consequitive numbers and try and make a jump
table. That is, if they see
1 do this
2 do that
3 and don't forget this
4 because something bad will happen

They just make a jump table with a list of jump vectors to the subroutines.

If there is a skip, like
1 do this
2 do that
3 and don't forget this
5 because something bad will happen

They generate a test tree like

If 0<par<4 then times two it and hit the jump table
else if 4<par then ...

Which takes a lot of time to evaluate when you are talking about something like a 6502 instruction set.

So the solution is to fill all unused op codes with NOPs to make a single jump table. Anything that isn't an opcode should be parsed as a 6502 NOP.

I also got in an argument with some Ruskie about 'form' for doing this too. He had some way of defining an array declaration such that it automatically produced a jump table w/o having to fill in the NOPs. Guy really got on my shit about how much white space and large my source files were compared to him, which meant he must have a longer 'dick' or something. I figured he was so socially retarded he couldn't see the benefits of doing any other way then his own and gave up arguing with him. He will find out the first time someone uses a non implemented op code and it brings his entire system to its knees. I decided not to tell him that, let him figure out error handling is a good idea on his own.

6922. Re: WTB: 65XEM (w/"AMY" chip) - anybody?

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-28 05:13:28 UTC
From: Curt Vendel <cvendel@worldnet.att.net>
Message-ID: <0o_M7.12315$V9.1407631@news.direcpc.com>
Source record: 32844

Most likely it was because the 65XE design was ready in Dec 84' (the 65XE was nothing more then an 800XLF being sold in Europe in August 84' redesigned and originally called the 900XLF, some of the first runs of the 65XE's actually have 900XLF on the bottoms of the motherboards)

Although shown at the Winter CES, the 130XE's were not ready until March 85' so it was easier for the Tramiels to show variations of the 65XE's, as those could actually have been retooled and produced quicker. The 130XE was delayed as several user groups were demanding Atari retain external expansion which fortunately it was, although it was never exploited to its fullest and the main products in the 80's: The MIO and the Black Box which were great products but didn't share well with others and broke the rules for using the PBI memory space for device drivers.

I have several of the product sheets you mention like the Grey scale & Red side bar product sheets. I used to run the Staten Island Atari Users Group from 85-89 and in March 85' Atari sent a product pak to me with all the various product sheets showing the different XE's, the ST's and the peripherals along with other announcements for products such as Atarilab, Plato Network Access and other announcements.

Well.... I've heard time and time again how "all proto's were destroyed" and so forth, yet amazingly those thought to be destroyed prototypes of various hardware turn up. Case in point, in 96' I was out at Atari and a woodchipper was around the back destroying what I was told were the prototypes of Jag II systems and motherboards and supposedly all were destroyed, yet last year I was able to obtain one and recently I was sent a 2nd unit and a bare motherboard and a box of various Jag II chips, so go figure....

Keep searching... patience and persistence will bring you rewards, I've been searching and hunting for Atari items for almost 20 years and the more you dig and search and research the closer you come, its like a good mystery novel, you need to read between the lines, look for hints, clues on the items themselves (such as dates, codes, address', telco#'s, names, and so forth) as these give you leads that bring you possibly a step closer, nothing happens overnight, but the fruits of your efforts are well worth it in the end.

The easy way to do it is like Itay says.

Just cut off the cord part from the brick to the back of the Atari and use the right gender disk drive connector soldered on the end.

The mini PC power supplies, 75-150 Watts, aren't that much bigger then the Atari brick and they last forever.

Some of those Atari power supplies were really bad. They potted the whole thing in epoxy so they overheat and can't be repaired.

6924. Indus GT Manuals...

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-28 10:58:12 UTC
From: Atarr <erasmus@6502.chip.old.folks.home>
Message-ID: <Pine.GSO.4.33.0111280552410.9444-100000@shell1>
Source record: 32847

In "news:JQzM7.7322$Kc2.818878@newsread1.prod.itd.earthlink.
net..." Ron Hamilton (oldatarian at atariland dot com) scribbled:
-> I remember the GT spreadsheet along with a word processor and data
->base. What else was there besides the DOS XL manual slanted toward
->the Indus?

To which, on Mon, 26 Nov 2001 at 16:04:53 -0800, Rick Cortese
(ricortes at netmagic at net) replied:
->Supposed to be an expansion to 64k and CP/M. I have seen neither of
->these.
->
->Short story. Bought my first Indus when B&C had them on sale for
->$175. Next trip in to B&C I told Bruce ~"You know the DOS XL and
->spreadsheet software bundle that is shown on the box wasn't includ-
->ed in the package." To which he replied ~"These were returns from
->Mexico", "The software wasn't any good anyway." I think he recomend-
->ed I switch to Top DOS.

Long story. (Sorry.) Okay, let's deal with this collection of
horror stories. (Nothing like defending a product that went extinct
15 years ago! [ha-ha!])

First, the Indus disk drive *always* came with four software disks.
The most important one was DOS-XL. All came with manuals or operating
guides, plus one for the disk drive itself. Some of those manuals or
guides were short, some lengthy. Later on, under Future Systems, they
were combined into one comb-bound book.

If you were sold a supposedly "new" product without all of those
items, then you were ripped off. Blame for that should go to the
vendor, not to the product. If you're still hot under the collar
about it, then you should trace down that vendor, show him your re-
ceipt, and demand appropriate compensation!

If the vendor sold the product package on some basis other than
completely "new," then your choices were either (1) to accept that
there may be certain differences in the package compared to the sale
of a completely "new" product, or (2) to not make the deal.

In other words, you can either buy the other-than-new product "as
is," or you can take your money somewhere else. I think if the Indus
company were still around today, they would tell you that this sounds
like a classic "as is" kind of deal.

It also smells! The vendor didn't provide a full and complete
package of all the items that should've been there, and in addition

the vendor talked down the product. Face it, you were ripped. The vendor looks bad, but that should have no effect on the Indus. The Indus remains the "Rolls Royce" of Atari disk drives.

As for the software programs (and manuals and guides), they were of varying quality. DOS-XL was an excellent program. It was an Atari-sized version of MS-DOS (on the "IBM"): a command-driven DOS with many options built in. Unfortunately, the real manual was not provided with the drive; serious users had to realize that it was needed and trace it down.

The word-processing program was also excellent. The database program was merely adequate. But it was useable, assuming that the user figured out (as I did) the mistakes in the manual and how to overcome the one big bug in the program. (Woe to anybody who either didn't figure all that out, or who didn't have access to the article I authored in the late '80s describing the fix.)

Those three programs were good, open, and compatible with Atari DOS 2.0. The fourth program was different. The spreadsheet was copy-protected, extremely limited in size, and junky. 'Nuff said.

As for the 64K CP/M module put out by Future Systems (the successor to Indus), it exists and it works. I made extensive use of it during one large programming project. There was software that came with it, as well as manuals. For something that turned a disk drive into a computer, it was rather awesome. However, by the time it came out CP/M was dying off. By the mid- to late-'80s the idea of "compatability with IBM" was becoming the dominant theme, and alternate operating systems and platforms died out as time passed.

If you gotta see it to believe it, you're more than welcome to buy the CP/M "Ram Charger" module.... [grin!] I've got an extra Indus with one installed, plus another new-in-the-box, never installed. But if you want to run it, note that you need to practically "refrigerate" the Indus, because the heat produced by the extra memory board overheats the drive. With the CP/M board installed, the Indus works fine as long as it's kept well chilled!

Final footnote: In addition to the five operating guides or program manuals that came with the Indus, the "real" DOS-XL manual was called "A USER'S GUIDE AND REFERENCE MANUAL." The copy I have, which went with DOS-XL version 2.30 (I believe that was the last fully-2.0-compatible, non-"turboed" version), was dated December 1983. 156 pages, including sections on batch processing and assembly language. This book was essential for any serious, DOS-XL Atari 8-bit user.

For the guru level Atarian, there was a 90-page book called "INDUS GT -- TECHNICAL USER NOTES." The copy I have is dated April 9, 1985, and is marked "last revision." For the superduper-guru level, there was a 200-some page book called "INDUS GT -- ROM CONTROL CODE, WART CONTROLLER, PROM V. 01.10 AND V. 01.20," dated March 15, 1984, with

source code. (!) There were also the various CP/M-related publications put out in 1986.

Final quote: "DOS-XL is an excellent disk operating system. It's versatile, easy to use, and has many nice features." --Angelo Giambra, author of "RAM DOS XL," in Analog Computing Magazine, August 1986, page 79.

hi andreas,
we have obtained the rights from archer maclean the author of
international karate, and dropzone to put them out as a cartridge.
he is currently working in partnership with the original author of
mercenary, escape, and encounter, we have obtained the rights to these
for cartridge projects also.
there company name is awesome developments, and of course they do today
playstation games, xbox, etc.
is this current version that is being done vastly different from the
original? the original is very very good, and i want it out on cart.
thanks,
lance

From: Dana Eckel <deckel@fedteldirect.net>
Message-ID: <qW9N7.753$Fm2.131472@news7.onvoy.net>
Source record: 32850

I have read about several upgrades to change the quality or features to Atari's Audio. I read that these exist, but nothing on how to do it.

#1 Atari Super Audio Modification. What does this do? Where are the plans?
#2 Internal Covox Expansion. It works with 8 bit samples, are there plans around for this?
#3 Atari Bypass upgrade by Ben Poehland. Don't know a thing about it. Any iinfo?

Thanks all!
Lets keep Atari Alive!

It's been years now since I've been into this, but I remember one thing: the external power supply kept the Atari main unit cooler while the C64 overheated with its internal power supply.

Unfortunately, I'm a software geek, not a hardware geek. If I knew the exact specs of the power supply and know what voltage and max power each pin needs I could probably make something if I can get the right connector for the Atari.

For anybody with experience in home electrical wiring repairs,
these things are often easily fixed. Many of them have fuses inside.
Replacing a blown fuse is just a matter of taking the old fuse to
Radio Shack and getting the right type of replacement fuse.

Are we talking about an 800XL here? If so, it is just needs +5V and ground.
The red wires on a PC power supply are +5V and the black are ground.

If you take a plug off an exixting power supply, it is already wired. You
only have to check which lead is ground and the other will be +5V by
default. Easiest way to do that is plug the cord in and use a continuity
tester/DVM/VOM to see which lead has zero resistance to the ground points.
Ground will be places like the outside of the RCA jack, exposed metal parts
like the cartridge door, RF shield.

Does anyone have an ATR or CAS of Warship by SSI? I know it exists for the C64 (I'm looking at the box) but I can't find it anywhere on the net for A8. Thanks, Mo.

6938. Q: Chelco (Suppliers of serial cables)

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-29 11:12:48 UTC
From: Anders Skelander <ansk@hotmail.com>
Message-ID: <lFoN7.1003$y65.3044@nntpserver.swip.net>
Source record: 32862

Some of my old Ataris have serial cables (for cassette
units and diskette drive units) made by a company called
"Chelco". Other cables do not have the "Chelco" name.

Does anybody know which suppliers Atari used, and also:

Is there a way to tell which cable version belongs to
a specific version of an Atari device?

For example, I know that my first Atari ever, a
600XL computer bought in 1983, had a 1010
cassette recorder with a cable made by Chelco.

I also believe that serial cables for the XE
type of cassette unit were not made by
Chelco.

The reason I ask for detailed information is that
I want to keep computers and serial units that
are as close to the original configurations as
possible.

Howdy Euskara

> What is a FlasROM?

FlashROM is kinda like an EPROM. The big difference is that with EPROMs,
you had to take them out, erase them, put them in an EPROM Burner, and after
burning you had to put it back where it usually sits. With FlashROM, you
don't have to remove anything. They are rewritten on the spot. Switch off
power and the memory will not be lost, just like on an EPROM or ROM.

They are used in just about everything that needs an update now and then.
Like extrenal modems and BIOS in PC's.

They are all completely compatible. The only differences are the colors they used in the cable which makes making things like sio2pc cables a little more complicated.

6951. Looking for file

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-30 03:42:25 UTC
From: m_jewison@hotmail.com
Message-ID: <5899f6aa.0111291942.9340b17@posting.google.com>
Source record: 32875

Guys,

I'm looking for a long-lost file which was, at one point, contained in the library of stuff on Compuserve before it went the way of the dodo. The file was called TKFreeze, and was a modification to the Transkey keyboard adapter formerly sold by Dataque.

I've checked a number of archive sites, but can't seem to find it. Does anyone have a copy of this mod or, if not, is there a site which archived the old Compuserve files? Muchos thanks.

- Mike Jewison

6954. New Release of Atari810 version 1.1

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-30 07:50:21 UTC
From: Zippy <zippy@mindspring.com>
Message-ID: <9u7dic$8f2$1@nntp9.atl.mindspring.net>
Source record: 32878

Hello All,

I've just released a new version of Atari810, the disk drive emulator in the tradition of SIO2PC, for the Windows NT/2000/XP platform.

This newest release has many new features including:

* High performance sio driver, running as a realtime process
* Graphical UI (in the "shape" of a real Atari810 - my first disk drive!)
* Session management stored in an xml database
* Disk image creation with customizable templates stored in an xml database

check out the screen shots and downloads at:

http://www.bitsofthepast.com/atari

> things like sio2pc cables a little more complicated.

OK, but my question was not specific enough.

I meant, if I would want to restore each cassette
unit, each diskette drive et cetera to an authentic
original condition complete with the right type of
cables, I need to know which cable/manufacturer
belongs to which unit type.

Example (right or wrong?): All Atari 1010 tape
units came with 'Chelco' serial cables. All Atari
1010 diskette drive units came with <???>
serial cables. And so on.

Btw, is http://www.chelco.com/ *the* Chelco that
made Atari serial cables?

Anders

Source record: 32882

Hey thanks, I actually have the Docs for Warship, Bismark I don't though. That was one way Avalon Hill and SSI pirate-protected these, by creating necessary docs.

On another note I've come across a couple of ATR's that work fine on an emulator, but when I write them out to floppy they don't work on the real 800. I've had a lot of success doing this with my 1050-PC cable and it's just a couple that don't want to work. Examples are: Panzer Grenadier, Battle of Antietam from the Holmes archive.

I'm still tinkering with them, but is there something that the emulator sees (or doesn't) that the real A8 can't. Usually when I get a bad or short ATR, APE will error out saying 'invalid ATR' but these aren't doing that.
Thanks again,
Mo

Source record: 32883

Well,
allthough I do own IK (or KI) as an original disk from System 3 software (from europe, in the Us it was Epyx and the game was called World karate championships), I do not play it very often. As far as I remmeber the standard IK has two karatekas or fighters (plus a referee). You can play against the computer or against a friend. Every now and then (depending on the points or belts you get) another background picture is loaded - and there are six background pix avaiable.

With IK+ you have 3 karatekas (or fighters) plus the referee (or master guru or whatever he is) fighting each other. I believe you can play 2 players vs. 1 computer opponent or 1 player vs. 2 computer opponents. Not really sure about that. I also do not know if IK+ has more than one background, etc. You know, I never had an ST, Amiga or C64 and IK+ was only avaiable on these systems. Maybe someone else can shed some more light on IK+. For me it looks like it is just another IK clone or sequel with more fighters and a few more/different fighter options (jumping tricks), thats all.

But I am very proud to hear, that Dropzone, IK, Encounter and Mercenary are coming as XL/XE carts soon. Well, I will get some extra x-mas money soon (er, tomorrow I believe, since today it is the 30th of november), thus I will do another atari order soon. Have to take a look at your list and how many new carts you released since last year. Quite a lot I think (by the way I will also order the new labels you made). Well, still hoping you can officially burn Montezumas Revenge (the 16k version) on a cart soon. -Greetings, Andreas.

6960. Re: Improved Audio on my Atari 800XL

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-30 18:22:44 UTC
From: Andreas Magenheimer <magea000@mail.uni-mainz.de>
Message-ID: <3C07CE74.EF3FF053@mail.uni-mainz.de>
Source record: 32884

Well,
the Pokey upgrade (called stereo enhancement, second pokey or simply Gumby) is described in several magazine articles. I had them on a medium/dual/enhanced ATR image, before my harddisk crashed (3 weeks ago). If I can recover this ATR, I will write a notice, so you can get it via e-mail. In the early nineties there were not so many programs avaiable for this upgrade. so I collected everything which supported stereo mode (stereo AMS players, stereo softsynth + world of wonders patch, stereo demos, stereo sounds, etc.) and put them on the disk with the articles. Around 1995 almost every new (polish/czech/slovak) demo had stereo sound, there were simply to many for me to collect them all. but you can find most of these demos online right now (visit Dely on his server Atari Area, there you will find all the newer stuff, the URL: http://atari-area.prv.pl or so...).
And there is a fine player called Mega-Player (or just MP) version 1.6 and 2.0 by MacGyver which plays many polish sound formats, like CMC, MPT, TMC and others in stereo or simulated stereo (if you have the second pokey/gumby)...

The covox is another story, it supports 8-bit digitized sample playback on your atari (normally pokey has only 4-bit digi playback, I believe). meaning, it is only useful for digitized samples, like WAV, MOD and some other digi sample formats (normally atari sample hardware/software sampled with 2-bit or 4bit, like Parrot, 2-Bit replay, sound`n sampler, ANG/mirage alphasys sampler, etc.).
I am not sure who made the upgrade, maybe tight, maybe Taquart or another former polish demo group that does not exist anymore. I once found the schematics on the net and sent them to ABBUC, but they never released it. nowadays I do not have these simple ASCII schematics anymore, nor do I know where to find them...
(But there were a few programs like Madteams MOD-player Inertia, which supported the Covox mod.) maybe you are lucky with xl-search or search engines like google and such... greetings, Andreas.

Its a nice little circuit, effectively a simple digital to analog converter. Not high fidelity, but pretty nifty. If you build one, you might use 1% tolerance resistors instead of 5% or 10%. Also, you're not limited to LS type chips, in fact, HCT types will interface a bit better to the Atari circuitry.

One problem with this circuit is it offers a widely varying output impedance which might end up causing distortion in the input stage of whatever amplifier is attached. The addition of an op-amp voltage follower on the analog output line would improve it.

6964. Re: Announcement: cc65 v2.7.1 released

Newsgroup: comp.sys.atari.8bit
Date: 2001-11-30 20:42:28 UTC
From: uz@musoftware.de
Message-ID: <kvq8u9.9gj.ln@dialin.musoftware.de>
Source record: 32888

I've tried to get this posted to comp.sys.atari.announce but either the mail address of the moderator has changed or he's on vacation. So the following may not be new news, but better old news than no news:-)

I'm proud to announce version 2.7.1 of CC65, a C crosscompiler / crossassembler combo for 6502 systems.

CC65 has C and runtime library support for many of the old 6502 machines, including

- The Commodore C64, C128 and the C16, C116, Plus/4 machines.
- The CBM 510 (aka P500), a quite rare Commodore machine (programs run in bank 0).
- The CBM 600/700 family (programs run in bank 1).
- Newer PET machines (not 2001)
- The Apple][(library support by Kevin Ruland <kevin@rodin.wustl.edu>)
- The Atari 8 bit machines (thanks to the Atari team: Christian Groessler <cpg@aladdin.de>, Mark Keates <markk@dendrite.co.uk>, Freddy Offenga <taf_offenga@yahoo.com> and David Lloyd, <dmlloyd@atari-central.com>).
- GEOS for the C64 and C128 (GEOSLib by Maciej Witkowiak <ytm@elysium.pl>)

The libraries are fairly portable, so creating a version for other 6502s shouldn't be too much work.

Version 2.7.1 is a bugfix release. It fixes a few errors/omissions in the documentation and all bugs that are listed on the "Known bugs" web page for version 2.7.0.

There is still no support for the following features:

* Floats and bit fields.

* stdio file routines on most systems. The 8 bit Ataris are the first machines that do have full file I/O support. Please note that the complete CBM family doesn't have stdio file support!

* The 80 column mode on the C128 is not supported by the conio library.

Available packages:

As usual I will provide the complete sources and several binary packages, including RPMs for RedHat Linux. Linux is the primary development platform, so the sources do compile out of the box on Linux machines.

Please note that there are now separate RPMs for the compiler proper and the target specific libraries. To develop for one of the predefined target

systems you need the compiler RPM package *and* one of the target machine packages.

Binaries for DOS and and Windows will follow or may already be available at the time you read this. OS/2 packages will again be available, but since there are almost no downloads for OS/2, so the host platform may get dropped in the near future (again). As with the RPM packages, you need the package for the development system (Windows, etc.) *and* one of the target machine packages.

Download:

More information information and a download link, please visit the cc65 web page at

http://www.cc65.org/

Thanks to all who sent feedback and suggestions and of course to anyone who helped developing cc65!

Hi,

> I meant, if I would want to restore each cassette
>unit, each diskette drive et cetera to an authentic
>original condition complete with the right type of
>cables, I need to know which cable/manufacturer
>belongs to which unit type.

I think the answer is "it really doesn't matter"!

AFAIK they simply packed whatever cables they had in stock at the time with the units, so you'll find some units came with one type of cable and others with the other type.

It probably also varied between factories.

> Example (right or wrong?): All Atari 1010 tape
>units came with 'Chelco' serial cables....

Here in the UK I've never seen a 1010 packed with a "Chelco" cable....

TTFN - Pete.

Note: there was a small bug in the setup program, and also the filenames in the source download were mangled to 8.3 format by mistake. This has all been fixed now.

->Of course, if you ever sell anything by auction read this BS take
->on auctions: (http://home.pacifier.com/~atari/caveat.htm) then head
->over to B&C ComputerVisions at www.myatari.com for your Atari needs.

Isn't that a bit harsh? Just because he says something negative
about auctions? (Namely, that the bidder may have to bid on an
entire lot instead of an individual item? And that sometimes there
may be shills bidding up the prices? Both of those things are true,
aren't they?)

I looked at the URL you cite, and what concerns me more is that
his claimed testing sounds like it may be more likely to wear out
a computer. Is running an Atari 8-bit for 48 continuous hours
really necessary in order for a seller to be willing to re-sell it
conscientiously? These Atari 8-bits aren't getting any younger,
you know! <grin!>

OK. I still think it would be possible to find out, for
example, that the Tramiels stopped using some
suppliers and started using others. That some
cable manufacturers were used pre-Warner and
some others during the Warner era et cetera.

It may not seem important now, but in the future, I
think many collectors will appreciate authentic
configurations of Atari equipment.

The implication is you can't trust Atari auction sellers. I myself test the Atari stuff I sell quite rigorously, though I only leave the computer on for 24 hours (I'm a slacker :)).

Also, I used B&C for repairs and stuff back in the day (read: the 80's) when I lived in the SF Bay Area. I know firsthand they can be trusted and do good work. Plus they don't post the same ad every few days in this newsgroup :)

He only says something negative in order to promote his own stuff. But the funny thing is that most of his stuff is far more expensive than in online-auctions even if the auctions should be shilled (btw. can he prove that?). Another thing, at online auctions I do see what I buy and I see from whom I buy (feedback).

It does seem a tad harsh to assume all Atari auctions are somehow fixed. Mine are all one item auctions and everything is tested before it's posted. Stuff usually sells for peanuts, the idea is not to bid the stuff up, but to have it end up somewhere where it will get used, rather than tosssed in a dumpster somewhere.

Hi there!

Just archived some of my utils with APE (thx to Steven Tucker for this great app).
Anybody interested in Atari 8bit utils (ie Amulet, Filemanager, C++ etc)?
What about Copyrights? Are they still "active"?

Please reply, so when enough users are interested and Copyrights are not a problem, I'll set a permanent Site with these great utils.

Oliver

Hi Mirko,

I'm working on it, but I'm going slow, and I won't be committing to any dates... thats what I do at work.

The Win9x is pretty much complete except for some technical difficulties due to existing bugs, documented by Microsoft, in the Win9x implementation of the Win32 serial port api. Specifically, detecting the serial ring indicator (which synchronizes all SIO commands) in an efficient manner is impossible with the Win32 api alone. Rather a custom vxd device driver is necessary to do this.

I'm hoping for some assistance from volunteers to ease the workload of porting to different platforms, not only because I'm busy right now designing some great new features, but also since I really don't use Win9x anymore. I'm primarily a SpartaDOS man myself ;-). Anyhow I think this approach will work. Already there is significant interest to port the code to Linux.

thanks for your interest,
-Dan

>suppliers and started using others. That some cable
>manufacturers were used pre-Warner....

True, but the point I was making is that I don't think there is a "correct"
cable for XL and XE series machines/peripherals.

Let me just get one thing straight, the "Chelco" cables are the ones with the
manufacturers name moulded into the body of the plug, yes (I ask as I don't
have any of these cables anymore - in fact I only ever had one)?

If so, then AFAIK, these cables were only used once the Tramiels took over
Atari. BICBW.

>> Here in the UK I've never seen a 1010 packed with a
>>"Chelco" cable....

> Thanks for reporting your observation! I will add it
>to my infamous serial cable investigation... ;)

OK, but don't take that as gospel....just because I've never seen one doesn't
mean they didn't ship the units with "Chelco" serial cables somewhere....

TTFN - Pete.

I had reasonable results by ignoring the command strobe altogether,
but I suspect you will have the most trouble with Window's (9x & NT,
probably 2k and XP too) horrible scheduling properties. Even if you
set up a high-priority thread to service the serial port, its
scheduling will be erratic. Not all the time, I discovered it had
trouble when I did things like scrolling IE or doing something with
lots of disk I/O. I still had trouble even after setting the thread
to maximum priority and only sleeping when not actually processing
characters. Windows is just a mess when it comes to anything
approaching realtime requirements. It works well enough to make you
think its reliable. It might be more reliable if you run it on a
really fast machine or just don't run anything else while doing serial
I/O with the Atari.

A vxd might help, but then somebody will have the pleasure of figuring
it out on lots of different Windows platforms. Ick. DOS is a much
better real-time OS than Windows.

Gregm

6984. APE vs Atari810

Do you know the XL-DJ, a Floppy-Emulator running on ATARI-ST-Computers? This program makes it possible to get access to a ATARI-ST-Disk by using the normal ATARI-DOS 2.x on the XL by using something like a virtual .atr-file. Wouldn't it be possible, that Atari810 makes the same? It would be nice to browse through windows-subdir's with MyDOS on the XL on a virtual .atr-file?

I would not mind having them. However, I would convert the ATR image to
a DI image so I could use it with 800XLDJ and my Atari Hades clone...

>....Windows is just a mess when it comes to anything
>approaching realtime requirements....

Since Windows 9x/NT has never been claimed to be a real-time OS I fail to see why you're surprised by this!?

If you need real-time response, you need to use a real-time OS - this generally means single user and no multi-tasking (e.g. DOS). Otherwise you have to put up with the foibles of the task scheduler....this is true for ALL operating systems from ALL manufacturers (DEC for example released several OSs for the PDP-11 line, only one of which, RT-11, was optimised for real time response).

TTFN - Pete.

Hi,

>> If so, then AFAIK, these cables were only used once the Tramiels
>>took over Atari. BICBW.

> "AFAIK"? "BICBW"? "TTFN"?!?

AFAIK = As Far As I Know
BICBW = But I Could Be Wrong
TTFN = TaTa For Now

All pretty standard shorthand. BTW, "TTFN" is what the very first mainframe I used in the 70's printed when you logged off....aah, all those hours wasted playing Star Trek on a 110baud teletype link.... ;-)

TTFN - Pete.

For one thing Win32 provides a "realtime" priority class the docs for
which suggest something realtime-like. Given the various Windows OS's
aren't real-time, but their behavior is really bad, not just nominally
adequate but essentially unsuitable for anything that needs accurate
timing. Perhaps vxd's are the way to get around this, but then you
have platform issues...

From the SetThreadPriority docs in Visual C 6;

"When manipulating priorities, ensure that a high-priority thread does
not consume all of the available CPU time. A thread with a priority
level of THREAD_PRIORITY_TIME_CRITICAL will execute until it
explicitly yields processing to other threads. Processing of these
threads is not yielded to other threads with the
THREAD_PRIORITY_TIME_CRITICAL priority level. Such a thread can
interfere with the normal operation of the operating system if the
thread does not explicitly yield processing quickly."

If you create a THREAD_PRIORITY_TIME_CRITICAL thread, it indeed runs
at a higher priority, even to the exclusion of other threads, but all
you have to do to screw up its scheduling is scroll an otherwise
inactive instance of IE. I'm just suprised how <bad> Windows is.

> response).

There are a variety of real-time OS's, no big deal, and many can
easily handle significant numbers of threads being actively scheduled
at different priorities and exhibit none of the scheduling pathologies
seen in Windows.

An unpatched Linux 2.2 kernel is not hard realtime, but is performs
considerably better than Windows; that is its worse case jitter has

been measured at 40ms IIRC in one metric I read, which is bad- but only occurs when the system is highly loaded and lots of I/O is going on. The 2.4 kernel has improved on this metric by quite a bit as I hear. From working on the serial comms in user-space Win32, Windows regularly exceeds that degree of jitter with only a trivial amount of auxiliary activity going on.

hi andreas,
i will keep the NG informed as to when it will be done.
i have had no luck on burning montezuma's revenge so far, all that i
can get out of it is a few machine code figures, then a black screen,
bummer.
but i will keep you informed,
thanks,
lance

Its true that a time-critical thread doesn't perform well in a standard or high-priority process. However, if the this thread is running in a realtime process (REALTIME_PRIORITY_CLASS), the results are quite adequate in my testing, at least in NT/2000/XP. I'm not sure about the performance of this technique in Win9x, and I'm also not sure what minimum CPU requirements are, but I've found that a P400 gives good results in NT. You've got to be real careful when writing code for that realtime process though... it can lock up your whole machine tight when it loops, since it's given priority even over the keyboard, mouse, disks, etc.

-Dan

Hi !

I own a ATARI800 and learned "computing" on it in "ancient times" :-)
Now I have a Linux box and I am missing all that ugly-wonderful stuff
from the 8-bit era.

What emulator (freeware / GPLed /GNU) is most recommended as an
emulator to "run" ATARI-stuff again ?

Does anyone know a source for the connector cable between the
ATARI800 and the 810 Diskstation? Is the pinout of both
sides known?

Thank you for any help!
M.

So that's what that meant! I remember- it was around 6th or 7th grade we had two teletypes at school and everytime I signed off of them it would respond with TTFN , nobody ever put 2+2 together and knew what that meant. Those really were the days....

Welcome to the comp.sys.atari.8bit newsgroup!

Atari 8-Bit Computers

Vendors and Developers List

"A comprehensive list of vendors, developers, publishers,
and repair shops for Atari 8-bit computers and their users"

Additions/suggestions/comments/corrections are needed! Please send to:

Michael Current
mailto:mcurrent@carleton.edu

Please refer to the latest version of this FAQ list whenever possible!

Available via these locations and Usenet FAQ archives everywhere:

http://www.faqs.org/faqs/atari-8-bit/vendev/

ftp://rtfm.mit.edu/pub/faqs/atari-8-bit/vendev

news:comp.sys.atari.8bit news:comp.answers news:news.answers

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
them in any way, are NOT listed here.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, PD/freeware/
shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the
developer are listed. No product can be developed by more than one
developer. No prices are given.
```

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Super-Brief Copyright Primer

Commerical software - protected by copyright, may not be copied except for personal archival purposes
Shareware -protected by copyright, may be freely copied and distributed, shareware payment required for continued use
Freeware - protected by copyright, may be freely copied and distributed, no payment required for continued use
Public Domain software - NOT protected by copyright, anyone may do anything with it, period.

Software is protected by copyright from the moment of creation. No copyright notice is required for copyright protection. Software does not enter the Public Domain unless explicitly released to the PD *by the copyright owner*.

My article "Intellectual Property Protection for Computer Software" appeared in Atari Classics, 3(1), 1994, pp. 4-7, or see:
http://www.library.carleton.edu/staff/michael/acarticle.html

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

"Hi!" to Marek Tomczyk, who has supplied so much information from Germany.
"Hi!" to Alex Martin, who has done the same for the land of Poland.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

Never seen Commando, the nearest to the actual game is a title called
"Who dares wins 2" which was a Commando rip-off.

My tests were using a P233, which might explain a lot. At the time I had the system rigged to multiboot Win95, which exhibited pretty much the same scheduling problems. Actually I noticed very little difference in performance between the realtime and "regular" high priority scheduling.

Have you tested your app while substantial I/O is going on?

Here is one web page which claims to have
a manual for that game:

http://www.crestviewfl.com/~richard/atari-docs.htm

This text is obviously not clear evidence of that
'Commando' was converted to the Atari home
computer, but it is possible to ask the owner of the
page about the source.

hi,
it exists but only in prototype form, the reason that it has not been
released is because it takes a special board that will make it very
expensive to produce.
if it becomes available some day we will certainly let this newsgroup
know,
thanks,
lance

That sounds exciting!

What is the reason for a special board? More than
64KB of ROM in the cartridge?

Do you know if there is a description of the Atari
incarnation of the game somewhere? Who wrote
it, when, technical specifications et cetera.

7009. Looking for "The Extirpator" (800 XL)

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-03 17:03:38 UTC
From: Marc <vooj@xs4all.nl.nospam>
Message-ID: <9ugb95mhl1@news1.xs4all.nl>
Source record: 32782

Hi all,

I'm looking for "The Extirpator" for the 800 XL. I already have
Extirpat.exe, but that doesn't seem to work with Nick Kennedy's SIO2PC
software...

Does anybody have an ATR version, or hints on getting it to work?

Thanks,
Marc

7010. Re: New Release of Atari810 version 1.1

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-03 17:40:23 UTC
From: Dan Vernon <dan@bitsofthepast.com>
Message-ID: <9ugd8l$2t0$1@slb7.atl.mindspring.net>
Source record: 32783

I have tested extensively under heavy load conditions and experienced the most interference in CPU bound conditions, like doing three or four large compiles simultaneously, instead of under heavy file, database, or webserver I/O conditions. Another problem area was high priority processes that steal all available idle time... like SNA Server, some screensavers, or SETI. These "greedy idlers" really cause timing problems for lower or similar priority processes. The time critical thread running in a realtime process fixed all of these problems. I'm sure you could make it fall over eventually... especially by firing off a competing process that spends too much time executing realtime time-critical code. The point is, for standard usage, it is very solid. You can compile code in the background while the Atari is loading, furthermore you can browse the web while backing up your Atari hard disk, etc. Heck, why not just download the thing and try it out for yourself. My slowest machine these days is a P400, so it would be interesting to know how it performs on a P233.

Hi Greg,

> For one thing Win32 provides a "realtime" priority class the
>docs for which suggest something realtime-like....

But that's the point, the "time critical" priority may be "realtime like" but will never offer true realtime performance since the OS was not designed from the ground up to be realtime!

>....various Windows OS's aren't real-time, but their behavior
>is really bad, not just nominally adequate but essentially
>unsuitable for anything that needs accurate timing....

I don't disagree with you for one minute there, in fact, IMHO I think that Win9x is a prime example of how NOT to design an OS. Period.

NT is a much better designed system (M$ actually employed many of the team which designed and maintained VMS for DEC to create NT) but is still compromised in many areas due to having to have a measure of Win9x compatibility bolted on. :-(

>....Perhaps vxd's are the way to get around this, but then you
>have platform issues...

To be honest with you I can't comment on this, I chose a LONG time ago not to develop for M$ operating systems (particularly on x86 hardware) so vxd's are something of a grey area for me.

> There are a variety of real-time OS's, no big deal, and many
>can easily handle significant numbers of threads being actively
>scheduled at different priorities and exhibit none of the
>scheduling pathologies seen in Windows.

But, and I think we're pretty much in agreement here, Win9x is a particularly bad example of OS design (I use the word "design" in it's loosest possible sense).

While it's true that there are realtime OSs which can run multiple threads, from my perspective (as one who used to write and maintain realtime operating systems for embedded systems) you get the most stable performance from a system which at most runs one task in foreground and one in background.

But this is way off topic for this ng....

TTFN - Pete.

Excellent. How do you structure your packet I/O timing? I tried busy
waiting the "realtime" thread to do packet timing, which ended up
being better then relying on the Win32 serial api for timing. As for
giving it a try, I really can't as, aside from vmware for those times
when I <must> use Doze, I've been completely Windows-free for the last
2 years- and I might add, happier writing code now than I've been in
the last 5 years. :)

Are you sure Lance?

I can't imagine it was a bank swapping game like Bounty Bob and as proved by 'Who dare wins' the game could be done minus anything special.

The only game I remember being close to not happening was Green Beret, it was passed on because the original people thought the Atari didn't have enough sprites to handle it.

Thankfully De re (old mate) took it on and made a grand job.

I think it is just a standard DIN-7 male connector on the A8 end. A DIN-5
from an old AT type keyboard would probably fit, *IF* you were careful to
avoid ever mistakenly getting it into the monitor out jack. I believe Fox-1
has the pinouts on his site.

7020. A8 + Flat Panel Display

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-04 00:20:22 UTC
From: llpwhite@cs.com
Message-ID: <20011203192022.17536.00000615@mb-fx.news.cs.com>
Source record: 32793

A month or so ago, I asked if anyone was using a LCD flat panel display with a VGA adapter with an A8. No one said they were, so I've been looking and checking (and waiting for prices to go even lower.) Today, I bought a Microtek 586p, and it works very well with the A8. But I'm convinced that at this time, many/most will NOT. The reason is the "native resolution" of flat panel displays -- typically 1024 X 768 for 15" and below and 12XX X 10XX or so for 17" and above.
Many LCD's will only display their native resolution or if set lower, will display very poorly. My Instant TV displays composite or S-Video at 640 X 480 at 31KHz. The Microtek 586p will display that very well as well as 800 X 600 and of course the "normal" 1024 X 768.

So if you decide to take the plunge at some point, make sure of the unit's display capability and that you can return the unit if you are not happy with the results. The Microtek has a 3-year warranty and was $350 minus a $50 rebate from Office Depot. I like this combination *a lot*!
Larry

Uhm, Ron. I think he wanted the Assem source listing.
I had the BASIC DATA statement writer file, but not the src
listing. I'm not sure #17 put a src on the disk.

In article <004077b5@fmlynet.org>, Greg.Goodwinp0.f2.n8.z8@fmlynet.org says...
>
> Well, I have thinned out my Atari collection, and I have all my extra
> Atari 8-bit and Atari ST here that I didn't need all boxed up.
>
I didn't know there was such a thing as extra Atari stuff. I still have most of my stuff from 15+ years ago. (I lent out a couple Happy-cloned 1050s that I never got back, I do miss them dearly).

My wife would even tell you that if the house was on fire, I'd save the computers first. (books second). Then I might run in for her. I tell her that's complete nonsense. I'd need some help getting all this stuff out.

Not bad for a computer I haven't booted up in almost 10 years, eh? And I just bought a 600 XL off eBay for four bucks. (and shipping was 10). 8-)

7027. Playin' SAP / SID on A8?

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-04 08:19:48 UTC
From: Thomas Havemeister <twh1@gmx.de>
Message-ID: <jl1p0u012mujki51sf7upboup36pm9db00@4ax.com>
Source record: 32900

Howdy *.*!

Does anybody know if it's possible to play those musice-modules .sid,
.sap on a real atari 8? I mean, it should be well done with .sap
modules. But .sid? Well I think it would be pretty cool to play it
with some small emulation enviromnet on a8, so it could be an easier
task to do conversion from c64 to a8.

(as seen on IK+ Project)

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

Weird isn't it..

Pretty much all the proto's got dumped ages ago and there's no reason why commando would need that much space as it certainly converted to every other system with smaller ram allowances.

Oh well..

Oh I love carts too..instant access is lovely but as Nintendo found with the N64, the cart is great it but offers great limitations and are costly on a couple of fronts.

Anyway, I still say that unless there was some MEGA version of Commando with rendered graphics :-) I don't see why a special cart was needed :-)

Perhaps it wasn't actually a special cart at all but a non Atari made one which just looked more complex than it really was?

Makes no odds tho, I doubt we will see this mysterious cart ever.. :-)

Shawn,

I'm not a C expert but I see one thing that may cause a problem. I inferred from your post that dl is an array of char, meaning that each element of dl is only 8 bits. However, address and (unsigned int*) for that matter are 16 bits. Although, C should type cast each element of dl with the next element as 16 bit when (unsigned int*) is used, it may not handle this properly. You may have to set each 8 bit char separately.

Just an idea.

> thinking that the address of some part of the array is an int?

The best (because most portable and most readable) way is to store the int as
a sequence of characters. So you would use

```
a[i] = v;
a[i+1] = (v >> 8);
```

You may also use pointer casting, but this is usually unportable. If you don't
care about that, use

```
*(unsigned*) (a + i) = v;
or *(unsigned*) &a[i] = v;
```

> (unsigned int*) dl[i] = address;
>
> I thought you could do that, but cc65 says no way. What is the simple
> mistake that I am making here?

You've casted the character at position i to a pointer to unsigned, which (in
addition to other problems) is an rvalue, so you cannot store into it. What
you need to do is to cast the *address* of the i'th character to a pointer to
unsigned, and use the '*' operator to dereference the it. See above for the
syntax.

Regards

Uz

7040. Converting my Atari disks to the PC

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-05 00:51:25 UTC
From: Dan Russell-Pinson <news@freecloud.com>
Message-ID: <hceP7.145039$fm5.29385572@typhoon.southeast.rr.com>
Source record: 32913

Hello everyone,

I have several video games that I wrote in assembly language back in the mid 80's that I am dying to see again.

I've read up on using a PC with a 5.25" disk drive and the AnaDisk software to copy the disk image from an Atari formatted disk. I would like to get some information before I dive in. I'm hoping that my floppy disks are still readable after all this time!

My main question: Is there anyone out there that can convert my Atari disks for me? I'd be glad to pay you for your time if you can help me. I'm just not sure if I'll be able to do it myself.

If you can help or point me in the right direction, please let me know...

Thanks!

Dan Russell-Pinson

Many things were announced, lots never saw the light of day thanks to
the marketing idiots.

Personally I doubt it was special, rarely did any of the later multi
platform games be anything but a port. I'd guess what was seen was *at
best* was a test cart.

I have for sale/trade, a 4-slave MUX system complete with docs, cabling, carts and ROMS.

Will go to high bidder or best trades. Get it now before it hits Ebay.

For those of you less informed:

The Mux System will allow you to setup one Atari master (complete with printer, floppy, hard drives, etc.) and share the peripherals on up to 8 additional 8bit Atari systems. Makes for a great file server or bulletin board system configuration!

Thanky for the reply, James!

....I forgot to mention: I am using Linux...sorry
Is there a Linux-version of a good Atari800
(and other Ataris)-emu?

Where can I find OS/A+ ???

Thanks for any help in advance,
M.

You definitely need a SIO2PC cable.
Good palce to start investigation would be
http://www.atarimax.com/

I offer those cables on Ebay, if you dont want to make one yourself.

> (unsigned int*) dl[i] = address;

> I thought you could do that, but cc65 says no way. What is the simple
> mistake that I am making here?

Depends first on what exactly you want to do. I've two ideas what you're
trying to:

1) You're using the address of dl[i] as a pointer to int and want to assign
an integer to this address. In this case,

*((unsigned int *)(dl + i)) = address

2) You're using the "char * dl" as an array of integers and want to assign
to its i-th element. In this case:

((usigned int *)(dl))[i] = address

The difference between 1) and 2) is how the index is used. In the first case,
the index is used as an index of a character array, in the second case as an
index into an int array. Presumably, int's are two bytes long, and char's are
one byte, then the example below multiplies the index by two before adding it
to the base address given by dl. Assuming that "dl" should mean "DisplayList",
then I'd bet you want to go for 1). (-;

Greetings,
Thomas

Hallo J131 :o)

...what I said was misleading, sorry...

I dont want to connect my ATARI810 to the PC.
I want to connect the ATARI810 to my ATARI800,
so I need a "SIO2SIO"-cable instead a SIO2PC-cable...

By the way: Is it still possible to get
a regular 5 1/4"-drive
(to to be inserted into my PC) and to read
ATARI Disks (written with Atari-DOS) with it?
I am using Linux.....

By the way: Ebay....I am living in Germany...

Thanks in advance,
M.

> the marketing idiots.

But :-), every other cart RX8077 through RX8099 came out (announced circa 1987). The later group of titles were in various states of development when Atari pulled the plug. Therein lies the Commando mystery, it should have completed long before things were shut down. A clue may be RX8100, "Mean 18 Golf". According John Hardie on this newsgroup, the prototype is also a mother/daughter board arrangement with 1 meg of memory. Perhaps these really big games were deemed too costly either in programming time or in manufacturing.

I suspect your A8 disks are single density, so Anadisk and other
PC utilities will not help you.
You could send them to Mo.
The preferred way to get things to your PC from A8 is sio2pc
or APE PC software and a simple SIO-serial interface you can
make.
You can get started at
www.redshift.com/~cdyson/atari.html.
Clarence Dyson's page.
I haven't used the sio2pc software, but it isn't disabled in any way like
APE unregistered is. I found APE unregistered ok to transfer files
using a program to extract the files from disk images on the PC.
imageman.exe is a good way to extract files from DOS 2/2.5 MyDOS
disk images.
Russg

Yeah for this kind of operation I use the 1050toPC cable with a 1050 drive hooked up directly to my PC via the cable. APE for DOS has the prosystem built in which utilizes this adapter. It can do ATR dumps as well as PRO dumps for hard to read or copyprotected disks.

Your disks should be mostly still readable if stored properly; mine from '83
are.

I have never had any success with Anadisk, but HiasSoft's AtariDisk aka
AtariLink serves me well on true double density in the PC 5.25 drive. I use
a Percom with the XL to convert Atari DOS 2 SD files to MyDos DD for
transfer to the MSDos world.

I can do them for you if you don't get something working.

How do you get the SWANDEMO to work as a screensaver using Xformer ??
Are you just running it when not using the Laptop, or is it actually
setup in some way to work with Windows ScreenSavers ??

7059. My 1050 disk drive is not responding - Need advice

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-05 20:02:52 UTC
From: Dan Russell-Pinson <news@freecloud.com>
Message-ID: <M3vP7.144311$HA6.23911304@typhoon.southeast.rr.com>
Source record: 32931

Hello,

I've just hooked up my Atari 800 and 1050 disk drive and I can't get the drive to operate. (the 800 is working fine)

The 1050's power light comes on, but when I turn on the Atari 800, it doesn't seem to go through its boot sequence. (Haven't used it in a while, but I seem to remember that turning the computer on should trigger the drive to start up and check for a bootable disk...)

I've tried connecting it to the 800 with three different cables, so I don't think it's a cable problem...

Anybody have any ideas? Are there any tests I can perform? (perhaps issuing a few test commands from BASIC?)

Thank you!

Dan Russell-Pinson

Took us quite some time to work that out too! Can't remember who actually figured it out, but it was one of the students rather than one of the teachers who'd been using the system for years....

>....Those really were the days....

Quite, there was something really addictive about those text based games.

IMHO most of the fun has gone out of games since they started coming out with hi-res bitmapped graphics and texture mapping - seems they spend most of their time getting the graphics right and none on the actual gameplay! :-(

TTFN - Pete.

Hi,

> The only game I remember being close to not happening was Green Beret,
> it was passed on because the original people thought the Atari didn't
> have enough sprites to handle it.

Couple of others for you that I still have as work-in-progess on disk...
(if you're reading this Steve then get in touch an you can have the disks
back!)

'Harlequin' in the UK (of Plastron fame, which was a port of Metrocross
until
the license fell through and they had to change the graphics!) were working
on conversions of two great Psygnosis games, 'Menace' and 'Shadow of the
Beast'.
They looked good too but were never completed as 1) licenses were expensive
and 2) everyone was ripping off Plaston as soon as it was released instead
of
buying it.

I'm reluctant to upload these anywhere without the author's permission,
so if anyone in UK knows the programmers, get in touch.

Whilst were on the subject I'll bring up again some adverts that were on the
loaders for US Gold tape games in the UK. They claimed 'Pole Position II'
(Atari?)
and 'Impossible Mission' (Epyx) were 'Coming Soon...' but did any
development
on these ever start?

Regards,

Mark

When you turn on the Atari, the drive should try and boot if it's seen.
With no disk in you'll get the "farting" noise and a BOOT ERROR message.

Is the drive set to be drive 1? There should be, if I remember right, black
and white slide switches on the back. I don't remember the configuration
for 1, but it may be with both switches to either the left or right.

That was always the order of the day...Nothing changes.

Slightly related, when I was still reviewing games Psygnosis sent me a
beta game called Draconius (may have been Draconus) on the Amiga, I
rang them up and explained there was at that point a game on sale with
that name....."Oh, is there...You sure?" they said, "I'm sure" I
said..

It later came out as Menace :-)

>I'm reluctant to upload these anywhere without the author's permission,

Dunno about Pole Position 2 but I heard rumours of Impossible mission
being canned before anything really happened due to thought's that the
Atari was too limited hardware wise to 'port' to.

Can't imagine it could not have been done, Berkely softworks could
manage great speech and apart from the highly animated main sprite it
wasn't overly technical

paul said,
Oh I love carts too..instant access is lovely but as Nintendo found
with the N64, the cart is great it but offers great limitations and are
costly on a couple of fronts.
Anyway, I still say that unless there was some MEGA version of Commando
with rendered graphics :-) I don't see why a special cart was needed :-)
Perhaps it wasn't actually a special cart at all but a non Atari made
one which just looked more complex than it really was?
Makes no odds tho, I doubt we will see this mysterious cart ever.. :-)

yea nintendo found out the hard way just like atari, by 1993 carts were
all but dead(unless its a handheld), but in the atari world 4 megs on a
cart would be hog heaven for me, just think of a flash rom cart with a
operating system on board.
just think of everything that you liked on atari fitting in the palm of
your hand.
going to visit another atari friend, walla! plug, and play!
thanks,
lance

Lol.

I remember doing 48K upgrades on 400's, I'd sit there soldering the
upgrade and the odd one had a duff ram chip so I'd go down and get one
from stock..

Christ, the price they were then for just a simple CMOS ram..

48K sounded so massive then, I could never imagine such heady numbers
as megs :-)

Well, I could scan that too. The OCR just does not recognize much of that atari font, especially in the smaller sizes.

There are 7 pages and I would expect them to approach 450K each for a .JPG large enough for readability. If Qwerty is still around and wants them, we can deliver...

I see there is no response to this and I would love to know.

What I have been doing is sharing a null modem link with a Atari ST. I
have bobterm running on the Atari 800 and Freeze Dried term on the ST. So
bobterm and the Atari 800 are the computer being typed on, but the ST and
freeze dried term are translating.

What is really funky is when I have Spectre running.... you type on the
Atari 800 and you have a Z-Term Macintosh screen doing the interpreting. :)

Anyway, as for solely 8-bit... dunno. Would like to know though.

Ron.
OCR would be the thing to do. I tried it with 'Warship' docs,
but my OCR can't do the little letters very well.
I have a readable .gif of the first of 8 pages I want to OCR.
It is 256k or so and very large image as viewed by IE or NScape.
My OCR software doesn't allow first enlarging the scan, then
OCRing it. Does yours? I mean I would think a good OCR
(we only have an old Omnipage limited edition) would allow you
to OCR enlarged scans.
And, Mo, if you're reading this, I did copy 'Warship', but I think
it is fairly well unplayable without the docs.

I'm not sure (since I don't have a 130XE myself), but since those lines go to
the GTIA (or do they go to ANTIC?) and PIA chips, it's p[ossible that it's a
memory expansion... and there's a 74158 in that little board too, plus the
additional 4050... Just to be sure, check if the 4164 RAM chips are still there
or have been replaced by 41256 ones.

Mo, I copied 'Warship' disks. Am trying to do something about
documentation. The manual is 22 pages, many just pictures and
stats of the ships. 8 pages of text.
Bismark is available already at spudster or maybe other places.
So are 'Crusade in Europe', 'Battle at Shiloh' and 'Chicimauga', which
I have also.
All of the available wargames probably need good docs, and probably
don't have them.
You said you have 'Warship' docs, so I'm gonna send you the
program files without the docs.

Howdy folks

According to his article in http://www.myatari.net Roland Scholz (roland.scholz@gerling.de) is having a problem which desperately needs to be solved. Maybe one of you can help. Here's a quote from the article.

Now we come to talk about the somewhat disturbing fact that it's neccessary to use the SYNC signal that is not connected to the parallel bus. Assume we issue a LDA $DE00,X command: This statement takes 4-5 clock cycles, one for loading the opcode, two to load the address ($00, $DE), one to add the X-register to get the effective address and one cycle (only if a page-boundary is crossed) to read data at the effective address. It is a feature (or a bug?) of the 6502 processor to put the absolute address (without the X-register added) on the address bus during the third cycle. The PC bridge now thinks it has been addressed and the above described process takes place. At the next cycle the processor has added the X-register and again put the address on the address bus. But since the PC bridge has been triggered before, it cannot cope with this request and will yield incorrect data. Unfortunately, programming storage-intensive applications cannot reasonably be done without indexing capabilities, so we have to find a way out of the maze. The way we look is to use the SYNC signal which tells us wether the active cycle is an opcode fetch. So the interface has a way to determne if the last statement has come to an end and can start processing the request. If you have any idea how this could be done in a better or simpler way, please give me a hint, for I really do not want to use signals that are not connected to the parallel bus.

Hope you can help him.

CU Mathy van Nisselroy

Howdy James, folks

The latest version is 2.16 and all versions now include the Enhancer. I'm pretty sure there was something mentioned somewhere in the docs that if you have an version older the xxx you should contact CSS because it wouldn't be upgradable, but I can't find it in the inline docs at http://www.nleaudio.com/css

BTW it is now possible to replace your BlackBox ROM with an EPROM. Check out my BlackBox page at http://www-users.rwth-aachen.de/mathy.van_nisselroy then click on BlackBox page.

I'm running a program called Seattle Labs Terminal Server on my PC, and
via null modem am connecting my 130xe (via BlackBox) to the PC.

The PC then provides a telnet prompt to the 8bit, so I can get out to the
Internet via the PC's network connection.

My question was originally posed because ICET stopped working for me, and
FlickerTerm is too hard on the eyes. I have since gotten ICET to work
again.

The CX85 has a B.A.S.I.C. poke loader to load the driver hex code
strings (string loader). I used it for typing in listings of blocks of
machine hex code in the days of the 6502 magazines. The device driver might
sit in the SpartaDOS scratch space under the ROM. I don't recall anyone
patching SpartaDOS and moving vectors around (maybe by now someone has?). The
keypad has a nice feel. (I vaguely remember someone using one with SynCalc,
or am I only dreaming? I think SpeedCalc had a keypad option as well?)

7090. Converting my Atari disks to the PC

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-06 14:23:13 UTC
From: Roy G Biv <erasmus@6502.chip.old.folks.home>
Message-ID: <Pine.GSO.4.33.0112060843550.11826-100000@shell1>
Source record: 32671

On Wed, 05 Dec 2001 at 00:51:25 GMT, "Dan Russell-Pinson" (news
at freecloud dot com; also atari at freecloud dot com) scribbled:
->I've read up on using a PC with a 5.25" disk drive and the AnaDisk
->software to copy the disk image from an Atari formatted disk. ...
->If you can help or point me in the right direction, please let me
->know...

I've sent this poster information on the "Myutil" (a.k.a. "Util")
program, which used to be all the rage on this 'base. (For what it's
worth, Myutil doesn't copy the "image" of an Atari disk. It directly
reads from and writes to the disk.)

Half a dozen years ago most postings on this subject recommended,
and/or dealt with, using Myutil. This raises a question: What
happened?!? Answer: The decline in popularity of Myutil presumably
reflects the disappearance of 5.25" floppy disks on what used to be
called "IBM-compatible" computers.

Incidentally, if there's anybody out there who's interested in
using Myutil (or who has tried it without success), you'll find the
help file that came with it to be almost useless. I fleshed out
that help file with additional comments posted here, plus a list of
tips I developed from actual use of the program. Anybody who wants
a copy of my help file can contact me at the address below. (Don't
"reply to" the address in the header; that's munged to foil spam-
mers.)

->I'm hoping that my floppy disks are still readable after all this
->time!

Mine are. But they've never been exposed to tobacco smoke or
dank or dirty basement or garage conditions. I've found that disks
I got from an ex-8-bitter whose disks befell both of those hazards
clog up my drives really bad! The lesson is that if one is going
to use disks that have been used by a smoker, you'd better have a
head-cleaner disk handy! Better yet, several of them!!

On Wed, 5 Dec 2001 at 11:18:15 -0500, "Russ Gilbert" (russg at
en dot com) scribbled:
->I suspect your A8 disks are single density, so Anadisk and other
->PC utilities will not help you.

As a footnote to my earlier posting, I might note that the Myutil program only works in true double density. In the interim the original poster has posted a later message noting that he has a 1050, which is a DD-compatible drive, so that means he can use Myutil on his "IBM" PC.

By the way, for those who tuned in late, I might also note that back in the heyday of the Atari 8-bits -- which is to say, the early '80s -- the product put out by the IBM Company was *not* the only so-called "PC." Our computers were also called PCs in those days! (Along with Commodorks and Apples and all the rest.)

But like the term "DOS," as time passed the term "PC" came to be used solely for the IBM Company's product and its clones. The term PC ceased to be a generic description for "home computers" and instead became popular usage for just one type of computer. That's how we lost our status as "PC"s. Oh, well. That's another reason for looking back on the 1980s as the Good Ol' Days!

7092. Re: Converting my Atari disks to the PC

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-06 15:05:22 UTC
From: Roy G Biv <erasmus@6502.chip.old.folks.home>
Message-ID: <Pine.GSO.4.33.0112060946100.11826-100000@shell1>
Source record: 32669

On Wed, 05 Dec 2001 at 17:50:30 GMT, "Ron Hamilton" (oldatarian
at atariland dot com) scribbled:
->I use a Percom with the XL to convert Atari DOS 2 SD files to
->MyDos DD for transfer to the MSDos world.

As far as Myutil is concerned, MyDos isn't the only DD Dos that'll work. (Even tho MyDos was mentioned in publicity for it back in the early '90s.) Any true double density DOS should work. I use DOS-XL, but I expect 2.0D (note the "D") and others will also work. I've found that the most important thing is to have "clean" disks: that is, disks with *compacted* files on them.

Myutil's ability to handle errors or tricky situations is very limited; it doesn't seem to be able to handle files strung out into little pieces all over the disk. Thus I use the copy *.* command, rather than the disk duplicating command, to copy files onto a freshly-formatted (on the Atari) double-density disk for reading by Myutil. Then when Myutil croaks on a file it can't handle, I recopy that file onto another newly formatted disk, and I keep doing that until Myutil buys it. In a word, Myutil isn't a full-fledged DOS program with error-handling routines built in. But it works.

That's basically what I did for the LMS instruction and the JVB
instruction at the end.

>one byte, then the example below multiplies the index by two before adding it
>to the base address given by dl. Assuming that "dl" should mean "DisplayList",
>then I'd bet you want to go for 1). (-;

Yep! :)

It works too (thanks to all the knowledgeable people on here.) I just
need to fix up the scrolling and DLI handling.

I was having a hard time allocating memory for the screen too, but
finally remembered that you can't cross a 4k boundary. Strange things
were happening on the screen until I figured it out.

Source record: 32714

I just got a Star Raiders cart with the 3rd label variation that I
have seen.

The variations on the carts I have are (going from memory,
unfortunately):

1. Star Raider Computer Game
2. Star Radiers Computer Game
3. Star Raiders Computer Games

Has anyone else ever noticed the variations on this particular cart?
Does anyone know why the variations occurred?

Thanks,
Trevor

Hi Mathy,
well, after looking at the schematic on his page, it is just not
possible to say what the problem is. the labels on the schematic are
not present and therefore untracable. It is standard for the cpu to
act as described and that is why the 02 clock is used so extensively
inside the atari as it times all r/w accesses and syncs all the
generated signals.

Ken

If it is a 3 position switch, you may have the multiple OS ROMs.

IIRC: Omnimon will come up if you hold down the OPTION + SELECT and press RESET.

For Omniview, type <ctrl>A and hit reset, you should come up in 80 column mode.

Of course you should have the normal XL OS so neither of these key combos will do anything in that position.

If you get nothing in one of the positions, it may be that you don't have one of the 3 ROM sockets filled.

Hi,

> I've seen two Defender carts, one with a Brown label for the
>800 and one with a silver label for the XE (?). Can anyone
>tell me if there are game play or graphics differences between
>the two ?

AFAIK both versions of the cart are identical in terms of
gameplay/graphics....IE they have the exact same code inside them.

I have been _told_ (but haven't seen for myself) that the later, silver label,
carts have a single 16K ROM inside them, whereas (as I can testify) the
original brown label carts have a pair of 8K ROMs inside. Cost cutting
measure.

TTFN - Pete.

Source record: 32725

I researched OCR software for the PC some.
Omnipage Pro 11 is $499! Caere (new name soft something)
also has a $79 OCR program.
There's another one supposed to be good for $99 (abbyy or something,
my memory ain't so great). They also sell (abbyy) a $399 office
version.
I found a $29 one, but it only OCRs what you can put in the
clip board of Windows.
I read a '99 review of 5 OCR progs. It seems most only get
80% to 90%. Some are better for preserving graphics of
a printed page.
Anyway, even at $99, I'm not going to buy just now. I can
scan using my wife's Officejet 600, and the limited Omnipage
doesn't limit the number of uses, it comes with the HP 600.
The problem is it will only take a single sheet of paper at a time.
I was thinking a digital camera might be a better alternative
than a scanner, less room taken up, more uses, and might
make a better photo copy of a magazine page in good light
than a scanner.
Most OCR software will allow you to use tiff, bmp, pcx files
as well as directly from the scanner (Omnipage only lets you
use what you scan.)

7111. Name of a game searched....

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-07 06:10:03 UTC
From: Meino Cramer <M.Cramer@alcatel.de>
Message-ID: <3C105D3B.6DA5CFF7@alcatel.de>
Source record: 32727

Hi,

I known...it is a long time ago...but... ;-)

I remember a game, but I cannot remember its name.
The game was roughly as follows:

The scene was a flat land (with hills at the horizone ?) with
"zylinders" or "pillars", one can hide behind.

The player was sitting in a kind of flying something (spaceship???
-- it was not visible to the player) and was looking out of the front
window of his/her vehicle.

The task was to shoot UFOs, which also can hide behind these kind of
zylinders and also tries to shoot the player. The UFOs were
played by the computer -- may be that there was a option
to include a second player ??? Dont know -- I only owned
ONE joystick in those ancient times ;-)))

If one has finished the task on the current level, suddenly
a "door" (more like a paper thin square..) jumps up from the ground
of the playing field and has to be searched.

Maneuvring the players vehicle through such a door
"beams" or "teleports" the vehicle
(and of course the player within) to the next level.

It was NOT "behind jaggi lines" or "rescue from fractalus" !
The thing was not with THAT complex graphics.

But it has kinda 3D-effect, especially when shooting or hiding
behind zylinders...

Would be nice if one could remember the name of this game.

Please CC: to mccramer "at" s "dot "netic "dot" de

Thank you very much !
Kind regards,
M.

Glad to hear it works again.

So your PC sets up the telnet prompt? What did it take to set that up? I know a lot of people do it, I guess I need to get my PC doing the same... take a load off the local BBS. :)

FamilyNet Newsgate

I first off all wanted to thank all that have replied so far. The complimentary batch of Old Hackers newsletters are currently in the works to get labeled and mailed soon.

For those of you that would like to be put on the mailing list to receive the disk images to run on your Atari emulator (or whatever) let me know, and I'll add you. I would put these images on a website... and maybe I'll archieve them there. But I'd like to send them out to people, if nothing else, so I can know my readers. :)

Take care and a great holiday season to all from all of us at JYBOLAC.

Hi Meino,

You may be thinking of the game Encounter! from Synapse Software. Your description
fits much of what I remember of the game. It was an interim game released while we were
all awaiting Dimension-X. Although it wasn't as "pretty", Encounter! turned out to be the
better game--in my humble opinion, at least.

I agree, it must be Paul Woakes Encounter, but I think it's from Novagen and
not Synapse.

Hi !

OH YEAH!

That's it ! As I see the name, my brain's flash rom (game's section) was
reconnected to the power source and TADA! I can remember the name, too
(but not the company...)

Thank you VERY much!

Howdy James

> Thanks for the information. Your site was helpful, but I'm not sure on
> any course of action. Should I modify my BB to be FLASHROM ready per your
> docs, or see if CSS will/can upgrade my current BB?

I just got permission from Bob Puff to upload the current version of the BB ROM to my site. Unfortunately, I only seem to have it in 'ready to flash' format here. I'll try and find the other format too. I uploaded the flashable version to my site inbetween composing this message.

The FlashROM stuff all came from Matthias Belitz, who has his BB upgraded with the FlashROM (I've seen it with my own eyes). Unfortunately Matthias doesn't have much time to spend on the 8 bit Atari. (He's job hunting abroad, so he isn't even close to his Atari). But he reads his email at matthias.belitz@gmx.net
Bob might be able to do a normal EPROM update for you, but he also complains of not having much time. Matthias checked with Bob before making the plans public, and Bob gave permission to publish them.

No, it doesnt matter if you use a half watt instead of a quarter watt resistor. thats because the wattage of the resistor is higher. The physical size of the resistor will be a little larger though, so the larger you go, the more difficult it may be to fit the thing into your box. Also, be sure to place the PLUS side of each capacitor to the proper pin. The capacitors are polarity sensitive. also the zener diode must be placed properly. Resistors are not polarity sensitive. I have built a lot of stuff over the years. I have found a good method of building prototypes without making an ETCHED pc board. just get yourself a BLANK UNETCHED copper pc board. available at most any electronics
supply house. Use the copper surface aa your NEGATIVE BATTERY terminal. now, any contact that goes to NEGATIVE, just solder it down. Take all of your components and glue them down to the board similar to the way the SCHEMATIC is laid out. use that "one drop holds a ton" kind of glue. but other glues will work too. Use some pretty THIN wire for your hookups. The thicker the wire you use, the harder it will be to build your project. Thin wire is ok to use on projects unless you are building a high-amperage device. Solid wire is much easier to use than STRANDED wire too. If you are a NEWBEE to circuit assembly, you should try to ask a friend who knows about electronics to help you a little. Most guys in electronics would be glad to help you. You can email me at mundy@utinet.net if you have any questions.

Could you also use one of those wall warts from Radio Shack (or elsewhere)
that
have selectable voltages? Most are listed at 300mA with voltages from 1.5
to 12 V.
Polarity is also reversible on some of the more expensive models. Anyway,
what
I'm asking is, could you wire the 800XL power plug into one of these, set
it for 5V
and expect it to work?
```

No, they just don't put out enough power. I've measured the current draw
from a few of my Ataris and they average ~1.2 amps.

Most of them don't have very good regulation either, 5V may be anything from
4-6V.

I just got stung really badly for a ATX power supply, $30, but I am assuming
people can still pick up old PC, AT, or mini tower type supplies for ~$8? I
mean around here you can pick up an entire AT for $10-$20 at a thrift store
and switching power supply 'pulls' cheaply

I think workable solution would be someone, such as myself, soldering a
female 4 pin floppy style connector to a 7 pin DIN connector. I haven't
priced them yet, but I assume it would be about $3 in parts and $2.60 to
ship<blister pack + postage>. I haven't shipped a power supply recently, but
I have shipped a 1050 which weighs about the same and I think the postage
alone was just over $10.

It makes sense to get the PC style power supply locally vs. ship.

The thing is, once you have this set up, it is the last power supply you
will ever need. If anything does go wrong, the dongle probably won't be the
problem so all you have to do is get another PC supply. For that matter, if
you have an existing PC, you could probably just run the adapter out the
back and not even have to buy a supply.

7122. Re: Practical uses for CX85 Pad

They can be very handy for any digit intensive activity. The only downside is they require a software handler which you cannot load when booting some commercial apps like VisiCalc or SynCalc. It does nicely with Compute!'s Speed Calc and some Basic listing entry from magazines.

Computer Shopper printed a versatile handler by Jeff Brenner around 1986; it included source code you could re-ORG for page 6 or the cassette buffer or even $C000 on a translated XL. You could even redefine the keys to your needs for any custom app.

We are a little light on specific symptoms and detailed behaviour. The first thing to check is drive # setting for both switches to the left looking at the back of the unit for D1. Next make sure you have a language cart or no cart installed as games do not trigger a disk boot.

Does the 1050 initialize and briefly spin the mechanism when first powered on and again when latched after inserting a floppy? Absence of these actions may indicate a problem in the drive circuity.

There is a way to use the resident disk handler thru the Device Control Block to attempt a disk sector read as part of troubleshooting, but it must boot the DOS to give any practical usage...

You can use the extra ram as ramdisk with meny DOS systems and run the
latest Polish demo's.
There are even people like me using 1Mb but for some things like running BBS
pro! it's still not enough....

Thanks! Very helpful info since I don't have docs for it. What I'd like to do is figure out which OS is which and I don't know how to do that. Was wondering if there was a peek for that.

I do think that one of the switch positions is "empty".

Well, the most widely extended use is RAMdisk, but there's some software which
recognizes the extra RAM and uses it, fo rexample one-pass disk copiers, Atari
Writer Plus (IIRC), Kedit... Or you could use the RAM for page-flipping
graphics, maybe. Post another message asking for programs that use extended RAM.

I got my SIO2PC cable and it works great. I downloaded an ATR for MYDOS but it's really DOS 2.5 with some mydos files including a .DCM file and I can't figure out how to make a MYDOS boot ATR file. Is there a downloadable ATR file for MYDOS somewhere? Or can someone tell me how to convert a MYDOS.DCM file to a MYDOS boot disk? Am I better off with SpartaDOS, and if so where can I get a .ATR file with a bootable SpataDOS?

Thanks,

John

What Sio2pc software are you using? If you are using APE, there is a feature to convert DCM>ATR. Only MYDOS can make another mydos boot disk(ATR). If you want I can email you a zip with all of Mydos's and DOS's on it.

If all 3 of your computers are giving you a "brown" screen, maybe it is your
monitor (if you are using the same monitor for all 3)? I have had a lot of
success fixing many atari computers by simply disassembling them.... then
gently prying up on each socketed IC slightly. You just want to lift it
a little on each end,... dont REMOVE it, just lift a little.... then push it
back INTO its socket. that is called "re-seating" the chips. It seems that
a microscopic amount of "corrosion" builds up between the pins and the socket,
causing many odd symptoms, depending on which pin looses contact. The
pluggable
pc boards on the model 800/400 should be cleaned using a pencil eraser on the
board contacts, then clean the contacts with Qtip soaked in alcohol.

If you find that SEVERAL keys on your keyboard in a ROW dont work, you may have
a broken foil trace on the back of the keyboard, (on model 800 atari) If you
carefully follow where the keys connect, you will find that the keys are
connected in a MATRIX. for example the keys 4,R,F, and V are all in a row and
have a common wire. If you know which row of keys is not functioning, you
might be able to follow the wiring and connect a jumper across suspected
foil traces. It is very difficult to SEE the broken trace. you may find it
using an OHM meter. The best advice is to re-seat all your IC's and
that has fixed 8 out of 10 problems I have ever had. works on many game
cartridges too. good luck. from mundy@utinet.net

The .DCM is a "Diskcommed" file - you need Disk Communicator 3.2 to convert
it to a floppy or ATR.

I have DiskCom on my BBS for download:

7138. IDE HD Interfaces

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-08 13:05:10 UTC
From: llpwhite@cs.com
Message-ID: <20011208080510.13748.00001168@mb-cj.news.cs.com>
Source record: 32658

Over the past several years, there have been several IDE interfaces developed and perhaps a few sold. I wonder if anyone can comment on these, and if there are any others still actually being sold? Here are the ones that I have heard about and as best I know, their current status.

Here's why I am asking... I have a Black Box and Floppy Board. This is an awesome upgrade for the A8. However, it is large. I would also like a HD interface that can be mounted internally -- preferably in an XE. IDE drives can be very, very small. And my goal is to interface a Compact Flash card as an IDE drive. It should be essentially as fast as a ramdisk.

SIO2IDE -- takes its place in the SIO chain, so requires no special software. Available as a PCB or finished unit. Same unit should work with either 800 or XL/XE. Would be limited to SIO speeds, but with no disk latency (same as with APE/SIO2PC).

MyIDE from "Mr. Atari". Point-to-point wiring project. Different units for 800 and XL, including a cartridge-mounted version for the XL.

Smart IDE interface from Bob Woolley -- as written up in Atari Classics. Uses 256 of the normal 512 byte sectors. Point-to-point wiring project. (IIRC, someone was re-writing the driver software to be able to use all 512 bytes/sector. (?))

German IDE interface. Would read CD ROM data? No longer available. (?)

Polish IDE interface. No longer available. (?)

Any others?
Anyone other than the developers actually build/buy/use any of these?
Any user comments/criticisms?

Larry

Source record: 32659

The reset thing is so simple, I don't think anyone ever posted peeks. That being said, they should all three have different values at the ~$C000 memory area and be different depending on the option use.

For instance, I think the OMNIVIEW will have things like the 80 column handler or ramdisk handlers in the $C000 area. It also has the ability to swap itself out and map in an Atari 800 OS and make the $C000 area RAM IIRC. I can't remember the key stroke sequence for this, something like hold down select and hit reset.

OMNIMON comes up in a machine language monitor if you have that. I think it immediately displays the processor register status and the memory location it was running at when the <select>RESET key was pressed. I think someone has the commands up on a web page somewhere. Most of them are single keystrokes like 'T toggles hex to Atari ASCII, R1 will read disk sector 1, 'Y starts the built in assembler.

Of course the stock XL OS does nothing.

Has anyone experimented with any of the SCSI to IDE convertors? I have read about several of these. They are real, and they do work. This would allow the more common, cheaper IDE drives to be used with a SCSI interface, such as the Black Box (maybe). It might also allow attaching a Compact Flash card as the IDE drive, while maintaining all of the nice featuires of the BB/FB combo.

Sorry, Dan;

I went thru an apparently similar situation with 4 different versions; none worked on an 800 or on the 256K 800XL which DOS 2.5 identifies as an XE. I have to pull out a stock XL for that classic.

BTW, has anyone else seen a version of Miner2049er where the protagonist is called 'Peyote Pete' in the opening screen?

I use a SIO2ST cable also. I used it with my Atari clone and a program
called 800XLDJ (like APE for the PC). There is a great little program
that runs in DOS that converts DI, DCM, ATR and XLD images and does a
great job. If the others cannot help you, email me and I will email you
the program.

>-Dan

I believe you need the Translator. I have used it sucessfully with my
130XE to run programs that were made for the 400/800 machines. Of
course I am using an emulator program called 800XLDJ, a SIO2ST cable
and my Atari Hades machine. I have the DI image of the program, but it
can be converted over to an ATR image using a program that runs in DOS.
Let me know if you would like the image file and the converting program.

I was having trouble for several days, but then just yesterday I was able to
download the 2.8 source. It still doesn't do the OSS bank switching right.
I had to tweak the code to get it to run basic xe.

From: ejgnandt@netzero.net
Message-ID: <4d2debfd.0112081511.4b8f1a3b@posting.google.com>
Source record: 32673

AFAIK, there is only one Defender version. Don't have the silver label
Defender, but a lot of brown carts were re-issued during the XL period
with silver labels and metal cases. The programs are identical. Some
titles got a third time around with silver labels and grey plastic
cases for the XE. A couple of oldies even got blue XE labels. Went
through my box and found these formerly brown carts:

Silver labels (w/metal cases)

Caverns of Mars
Centipede
Dig Dug
Super Breakout
Tennis
E.T.
Space Invaders (! didn't remember seeing that one)

Any others?

7151. DUP.SYS location

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-09 00:50:51 UTC
From: John McCulloch <mcculloch@accesstoledo.com>
Message-ID: <9uucjv01k4m@enews2.newsguy.com>
Source record: 32674

I've now got MYDOS 4.5 and can't get it to look in the ramdisk for DUP.SYS. It creates the ramdisk and puts DUP.SYS there but it won't look for it there. A very old MyDOS 4.1 disk does it right and I've tried putting all the AUT and AR0s therefrom in many ways on the 4.5 drive and still I can't get it right.

Is there something in DOS.SYS that has to be poked and rewritten or something to get the system to look at D8 (the ramdisk) for DUP.SYS?

Thanks,

John

7152. Price check on some Atari hardware?

Message-ID: <XHzQ7.21321$Yy.295094@rwcrnsc53>
Source record: 32675

Realizing that I've moved more times than I've hooked up my Atari PC, I have decided it's time to sell the beast. I would appreciate it if I could get some general opinions about what this hardware might be worth. I'll likely sell it through Ebay unless somebody reading this happens to live in the San Jose/San Francisco, California area and simply wants to meet me to buy it outright. This is from memory, I don't feel like going to the garage just now...

1) Atari 800XL, vanilla config.
2) Atari 800XL, Rambo 256k upgrade installed.
3) Atari 810 floppy drive
4) Atari 810 floppy drive with Happy board installed. (I don't think I have the software though)
5) One of those multi-port hub thingies that lets you plug in multiple devices.
6) A smattering of games on cartridge
7) I think I should still have a MAC65 assembler cartridge as well.

If time permits I'll dig it all out and get more specific information.

Best regards,

Tom

JPEG viewer, ported from the C=64, but it doesn't use the extra RAM,
or not yet at least. There are a few games that take advantage of the
extra RAM for things like digitised sounds too, but not that many
(can't name any off the top of my head).

FamilyNet Newsgate

Re: Converting my Atari disks to the PC

For single density ATARI disks the user would need either the program ATARIO
or the program Mule/DOS-Mule/PackMule.

In the mods I've seen, the 800 OS is with the switch in the down position, the 800XL OS in the middle position and a custom OS or the CDY/SWP OS in the up position. What did they call their OS? RamrodXL or something like that. Of course, whoever installed the chips could put them in any order and never put a third option. You could always boot up an "800 only" program and see which OS works.

Yes, John;

The .AR0 Ramdisk setup program normally changes the byte in DOS.SYS which contains the location from "D1:DUP.SYS" to "DX:DUP..." where "X" is the RAM drive designation number. You could POKE it from Basic, but is a little trickier from other apps like TextPro. Might append a second binary file to the .AR0 to fix that one byte if the .AR0 execution does not set it incorrectly...

In MyDos 4.53 the "1" in D1:DUP.SYS is at 7089 or $1BB1; probably very near
that in 4.50 as well.

For the BlackBox, can anybody provide the head/cylinder config for a 200mb Syquest cart. drive (50 pin scsi)?

I assume since I used the 44mb variation on my 8bit (now using the 135mb), I should be able to use the 200mb without issue.

Any assistance appreciated.

7174. Reading Atari Disks (810) with a PC-drive

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-10 08:42:29 UTC
From: Meino Cramer <M.Cramer@alcatel.de>
Message-ID: <3C147575.3E530110@alcatel.de>
Source record: 32695

Hi,

is it -- from a technical point of view -- possible to
read disks, which were formatted and written on a
ATARI 810 drive in acnient times ;), with a standard
5.25"-drive on a PC?
What technical precondition must be fullfilled before
trying to do so?

May someone has already constructed some software
for that task ?

And (last question :o) I heard different things about
the SIO2PC-software. One was to connect an ATARI to the
PC (PC emulates mainly disk drives) OR to connect an
ATARI810 drive to a PC to read the disks to a PC.
Is both be possible or is it a contradiction or...what?

Sorry for that newbie questions, but the FAQ wasn't clear to
me in the points regarding what I have asked above...

Kind regards,
M.

AFAIK SIO2PC hardware used along with one of PC programs does exactly what you wrote: emulates Atari disks (and possibly other peripherals) on a PC. Real Atari computer must be present to provide power and commands to the interface. With any standard atari disk copier you can copy your disks from real (ea. 810) drive to emulated (PC HD that is) drive. Or vice versa.

There is however a slightly different piece of hardware: 1050-2PC aka Prosystem cable which allows you to connect 1050 drive to the PC. Both power and commands are supplied by the PC in this case. It works with one software only (Prosystem, part of APE distribution; credit for that goes to Steven Tucker) and I dont know if it works with 810 drive; according to the documentation it works with stock 1050 drives only..

And there is 1050-2-PC hardware from Nick Kennedy, to connect a 1050
to the PC. Reading and writing is possible using options of the SIO2PC
software written by Nick.

Hmmmm....there are much support for the 1050 drive...but my disks
are written with a 810 drive.
Does anyone know of a possibility to read those disks
"into" a PC -- best would be with a standard 5.25" drive...

On the other side; Is it possible to read 810er disks
with the 1050er drive...this MAY say, that it is
possible to read 810er disks with the softwae/hardware
you mentioned...

810er disks can be read on a 1050 without problem. I think there is
a good chance that Nick Kennedys software and hardware would work
with a 810 as long as you don't set enhanced density or double
density mode which the 810 does not understand.
You could try whether Nick is still reachable via
nkennedy@tcainternet.com . He's always been very helpful.

Your site looks nice, great pictures, but could you please translate it into
english?

Matthias told me there should be no reason why your interface couldn't work
with ASPI. You know, ASPI is where the hardware specific code is put in a
separate file. So you don't have to write every tool for every SCSI or IDE
interface, just the 'ASPI manager'.
Check out my ASPI site at
http://www-users.rwth-aachen.de/mathy.van_nisselroy/ click on ASPI page.

> This week, one of my projects will be to incorporate all my external 8bit
> peripherals into a standard desktop PC case.
>
> That being the case, can anybody provide the power requirements for the
> BlackBox. Will it take 5 or 12v via a PC power supply? What's the pin out?

Mine works on +5, +12 and either -5 or -12. Has done so for years.
I'm not sure about the exact pin out. (mine has a 4 pin power connector
(not standard PC power connector) but there are others.)

Tell me if you have the same connector and I can give you my pin out.
(Bob Puff told me the BB needs either -12 or -5 VDC. Doesn't matter which.)

CU Mathy van Nisselroy

PS don't forget, switched power drops it's voltage faster then non-switched.
(if you have a solution for this other then "keep the cable as short as
possible", please tell us.)
PPS make sure you use connectors to take the power from the tower if you
don't know how to fix one of these towers yourself. Saves a whole lot of
explaining and if you have it warranty.

1802 had/has the number of drives in DOS 2.0/2.5. I would guess
MyDOS uses the same location.
For instance, if you PEEK(1802) and get 15, DOS recognizes
4 drives.
I would guess MyDOS uses the same location and a 255 at 1802
would serve 8 drives.
POKE 1802,255, then goto DUP.SYS and write DOS files.
1802 is a bit thing. bit 0 is for drive one, bit 1 is for drive 2, etc.
00000111 (decimal 7) would be 3 drives.
11111111 (decimal 255) would be 8 drives.

Meino.
Your best bet is APE or SIO2PC. I think.
10502PC would also serve. You would need to make the cable(s).
A PC cannot read 810 single density disks without an unusual
floppy controller, and is sorta unreliable even with double density.
810 and 1050 single density are the same, you can read/write
A8 sngl dens on either drive.

I asked Bob Puff about this when I set up my BB. He says that theoretically speaking, using any size drive is permitted, as long as it talks SCSI-I. You need a parity pal modification for your BB to talk to the newer drives. And you will only be able to access the first approx. 1gb of drive space with the BB partition manager. Personally, I prefer removable cartridge drives with the BB. Then you can have several cart for all the SSSD-size partitions for disk images, another full of big 16mb partitions for dev work, etc.

I'm glad you do what you do, you provide a needed service however,
my opinion is that your opinion is skewed. What you have is poorly informed
bidders who don't know when to stop bidding. There is nothing wrong with
the auction process. The key to any auction is knowing exactly what the
item is worth before you even bid. If the seller cannot answer your
questions, for heaven sake don't bid! How hard is it to research prices
or check dealers before bidding? I think it is the ill informed bidder who
has left his brain at the door.

Later MyDos versions could add drives on the fly and did not need to preset
location 1802. John was not having trouble with that; his Ramdisk.com was
not updating the file name and drive containing Dup.Sys after copying it
from D1 to D8. Typing "Dos" caused it to look on D1 instead of the ram drive
and slowed things down.

BTW, MyDos will supposedly search all drives for Dup.Sys when it fails to
get in the 1st place it looks.

You assume correctly, I love mine! 2 heads, 2,260 cylinders, and if you
have the same luck I did, you can't 'set' this anyway. Every time I
tried, the hard drive format program would change it to the above setting
automatically, doesn't seem to be a way around it outside of running custom
formatting software.

Are you using the 200mb Syquest on an 8bit? If so, can you use
(read/write/format) the 44mb and 88mb carts. on that 200mb drive via the
Atari?

I discovered the auto setting issue last night, but opted to stay with the
44mb until I could determine if the 200mb would use the 20 plus 44 and
88mb carts I have; as I only have 2 or 3 of the 200mb carts.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

Source record: 32572

I remember the term RamrodXL from way back. By the way, I think your evaluation of the switch position is right as I have better luck with the middle position for MYDOS. I'm currently trying to get MYDOS to do the ramdisk properly and have gotten GREAT help on this newgroup. After that, I'll try to refresh myself on OmniMon. The 800XL I have has 256K, with multiple OSs and OmniMon (I think). The keyboard was ridden hard and I replaced it with one from another 800XL which had none of these enhancements which many years ago I knew how to work.

I must say that if the internet and this newsgroup had existed back in '85, I NEVER would have sold the aforementioned machine.

Thanks to all on this newsgroup!
John

I remember starting to make my own little version of the MAC65 toolkit to minimize memory usage. If anyone remembers, the MAC65 toolkit had some nice macros for OS access like SIO and floating point access. What I didn't like was that it included many subroutines to be called by such macros and ALL toolkit subroutines were included in any program that used the toolkit. I started adding lines to check whether each routine was actually being used and included only the routines that were actually called by the respective program. As I'm just getting back into A8, I have a MAC65 cartridge that I haven't tested and none of the work I did way back when. Has anyone done the same? Without an actual linker this was the only way to make sure that unused routines were actually left out of the program.

Hiya.
Ok (mydos 4.5 doesn't use 1802 for # of drives supported.)
I looked at the mydos 4.5 manual.
If John was running the ramboot.aut for mydos, it should
update where to look for dup.sys and mem.sav.
and mydos looks for dup.sys starting at d1: and goes up, I guess
if ramboot.aut was run.
I'm not a mydos or ramdisk user.
So all this is interesting, and John M. says in another post
that info helped.
But, I still don't see the solution, did he solve the problem?
Was he using a different ramdisk program?

>

Yes, I have used the 200mb Syquest with BB on Atari. The 44 and 88 carts
are both supposed to work in that drive, but with our 'autoset' bug, the
only way it would work for us would be to spend a few days partitioning,
formatting, and then testing to the end of guessed at partitions until you
fall off the edge of the world. Don't know if head one is used all the way
to cylinder 2260 and head two takes over from there or not. Only way to
find out for sure is to dive in, which is why I haven't done it yet.

To scope mine out at first go round, I set it up as U#1,lun0 with a 17
sector gap at the front so I could then use it as first hard drive and
just fill in the configuration data and controller list when I finally
make the move to put it on line for good. I haven't done that yet either
as you kind of caught me in the middle of moving to a new Atari hard drive.

7203. for sale Atari 8bit cassette games

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-12 10:24:19 UTC
From: carmel_andrews@hotmail.com
Message-ID: <6912483e.0112120224.2d20ba05@posting.google.com>
Source record: 32576

I have a large collection of Atari 8bit cassette games for sale, over 230 games, 100+full price (7.99/9.99) and 130 budget games (1.99/2.99)

I am selling them as one unit (no splits, as I have boxed them up), some games (less then 40) have no orig packaging (cassette inlays)

Because of weight/cost ratio inposed by courier/delivery firms, as the box weighs over 20kg's, the buyer must collect, or arrange courier collection

I am selling this collection at ï¿½200 (two hundred pound sterling) no offers

Or highest bid secures collection, this message isn't duplicated on ebay (as they do charge a fee for the service)

For interested parties, please call- do not email, that is DO NOT EMAIL, telephone me only on 0207 278 4244 (+44 IF DIALING OUTSIDE BRITISH ISLES/UK)
and ask for Carmel

Hello Curt, hello Atari fanz, hows the atari going

Re: Amy chip and 800xlf

Although Atari tried to get a working version of the chip ready for the 8bit series, as with most things Atari did under the tramiel admin.. they never got round to mass production, the excuse that atari gave was the 'poor' h/w development tools Atari had access to, strange considering that Atari became only the second computer manuf. (after commodore) to manuf. and mass produce their own processors, as Atari manuf. the xl and xe and gtia version 800's 6502 variant, I also understand that they had a deal with motorola to produce and manuf Atari versions of 68k for the ST series, in addition to that Atari also had a hand in designing and orig. r+d into the 65816 (the first true 16 bit version of the 6502... the m.o.s equiv. i remember called the 65000, apparently didn't get passed the drawing board stage) According to sources at Atari, and articles in various Atari mag's in the mid 80's, Atari apparently developed a working version of the AMIE/Amy chip for the ST series, and were planning to mass produce it, I guess like Atari's proposed cdrom drive for the st called CDAR, the ST version of amie/amy went the same way as the 8bit version (by the way I actually saw a CDAR demo'ed in a glass case at an ATARI stand at one of the Atari shows in london (either 86/87)

Re: the 800xlf... this version of the XL was never released/mass produced by AtARI, your'e getting mixed up with the 800xe, although I did once know someone who owned a fully pop'd 800xlf mainboard (don't ask me if he still has it)

Carmel,

The 800XLF is merely the final production run of the 800XL, with a
Freddy on board. Nothing special about them at all...

7208. Re: Reading Atari Disks (810) with a PC-drive

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-12 22:13:21 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <5EQR7.6463$vK1.679651@newsread2.prod.itd.earthlink.net>
Source record: 32581

All 1050s can read 810 disks, but 810s are unable to read some 1050 disks because of the possibility of the dreaded enhanced density and-a-half available with Dos 3.0 & 2.5.

SIO2PC and APE use a similar cable to connect a real Atari to a PC which simulates a disk drive; additional real drives may also be connected for data transfer between disk and disk image. One caveat is my Percom drive which is incompatible.

There is a second similar cable allowing PC software to read/write directly to a 1050 drive with no need for an Atari computer. Theoretically this device should also function with the 810, but you cannot ignore the Percom factor...

You cannot read 810 disks directly with a PC 5.25 unless it is very old and has the single density floppy disk controller card.

Source record: 32590

I have a non working Atari 1050 disk drive that I am trying to fix. It seems that the stepping part on the drum (I don't know the technical name for it) that rotates the diskette is missing a clip and some other part.

Does anyone know where I can find a complete part list for 1050, and be able to order some of these? Or, does anybody have a non working 1050 with good mechanical parts for sale? (US preferably)

Please let me know,

Krystian

7217. Re: Bounty Bob on 130XE

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-13 04:42:44 UTC
From: Dan Vernon <dan@bitsofthepast.com>
Message-ID: <9v9beh$5cr$1@slb7.atl.mindspring.net>
Source record: 32588

Hi Ron,

The author who originally hacked up the disk version of bounty bob didn't "OR" the existing bits of PORTB to change the memory mode (which generally works best), rather just stored a value in there directly. The problem with this is that the XE banks memory on bits 4 & 5 of PORTB (which had no meaning for XLs). So, I just had to change all the PORTB writes to be XE compatible and the thing boots fine.

However, after playing with my fixed version of Bounty Bob, as well as several other versions I own, I find that all of them will not play level 6 of the game, instead it just locks up. Even without my changes, this happens. So does anyone have a disk version that will play level 6 that would be willing to share? I would offer to fix it to boot on the XE.

-Dan

P.S. Remember the cheats:

Press OPTION to enter the option screen. Use the down arrow to move to the "Special Code" line. Use the joystick to select 61800. Move left to go "down" from 0. Hold the "F" key on the keyboard and press OPTION. Now when you're playing the game you can type any two numbers to jump directly to that level; for example type "06" for level six.

Level warps:
Use the following directions to jump to various levels in the game.

Level 4
Collect the flower pot on level 1, Bob's Morning Calisthenics. Then hold 1 and press Start to jump to level 4.
Level 22
Collect the aliens and paint roller on level 2, Utility Hoist. Then hold 3 and press Start to jump to level 22.
Level 15
Collect the goblet on level 3, The Suction Tubes. Then hold 4 and press Start to jump to level 15.
Level 18
Collect the coffee pot on level 5, Jumping 101. Then hold 8 and press Start to jump to level 18.
Level 14
Collect the pitch fork on level 10, The Gravity Lift. Then hold 5 and press Start to jump to level 14.
Level 19
Collect the pie and tube 1 to the left on level 16, Advanced Suction Tubes. Then hold 9 and press Start to jump to level 19.

Level select:
Successfully complete the game. A message with level select instructions will appear. Set special codes 1 through 25 at the "Game Adjustment Screen" and press Start to play on the corresponding level.

Hidden messages:
Enter one of the following special codes at the "Game Adjustment Screen" and press *.

Hi,
I am sorry to hear that alt.atari.warez is the only place you are
posting it. A lot of the atari newsgroups are not available to many
many users. I am sure one or more of the atari long time 8-bit peple
would put it on their web page for everyone to access. I hope this is
the way you go. Thanks

Ken

The ST series used stock 68000 chips - nothing custom about them.

Hi,

> There is a second similar cable allowing PC software to
>read/write directly to a 1050 drive with no need for an
>Atari computer. Theoretically this device should also
>function with the 810, but you cannot ignore the Percom
>factor...

I don't see why there should be any problem with this, the 810 and 1050 after all both respond to the same command set. AFAIR the only difference is that the 1050 has an extra format command for enhanced density.

> You cannot read 810 disks directly with a PC 5.25 unless
>it is very old and has the single density floppy disk
>controller card.

This is something which has always intrigued me....just how is it possible to read an Atari disc using a PC drive even if you do have and old controller card which has been modified to read SD discs (AFAIK NONE are without modification)?

The thing is Atari took the step of not using the index hole, instead using a "timing gap" to mark the start of each track. Thus, theoretically, a track can start anywhere you like on the disc surface.

How then does hardware which relies on the index hole, which is most hardware including PC FD controllers, cope with this? Even if you command the FDC to read the entire track in "raw" mode, it still has to know where the track starts....

TTFN - Pete.

7226. Searching for "Abenteuer im Kaufhaus"

Hello all!

I&#65533;m searching for a game from a German magazine (possibly Happy Computer) entitled "Abenteuer im Kaufhaus" or something similar. I remember the listing was for several computers "en vogue" at the time (ca. 1985/86) with certain alterations for the different platforms.

Anyone?

I'm looking for some code to load common picture file formats on the
8-bit. Preferably in BASIC, ACTION, or C. Even a description of the
file formats would be nice.

Is MicroIllustrator the most common? (.pic)

This is for a small game library I am programming with cc65.

Thanks. I read your disclaimer about your server only allowing 6.4KBytes/s...
well, my ISP also limits my (cable!) connection to 64kbit/s[*], so I wouldn't
have noticed... (maybe they belong to the same owner?)

[*] And that's just for standard HTTP transfers, anything using a different port
(even FTP!) is limited to 20kbit/s...

Source record: 32610

Hello Kevin,

I think that what Greg is trying to do is revive the user group and write new newsletters. He asked me where he might be able to get quantities of DSDD, 5.25" floppies.

I told him that in today's day and age a Web site might be more practical and appropriate.

Take care.

Alan

> mechanical parts for sale? (US preferably)

For the schematics and service manual in both English and German look at
http://www.abbuc.de/bauplan/index.html They are only DM9.00 or Euro 4.60
from January 1st. That's NOT including shipping and handling. If you speak
German, why not become a member of the ABBUC?

For part try http://www.best-electronics-ca.com make sure you order there
Catalog. It's the closed thing to an Atari Encyclopidia you'll have have.

Source record: 32613

Howdy folks

I'm a member of the ABBUC. It's an Atari 8 bit only user group with over 400 members world wide. There are 6 disk based magazine a year and at the end of the year there is often a free gift. This year it's Bombdown. A great Minesweeper look a like. It's best played with a mouse. (check out how to convert your ST Mouse so the right button will work on my "some stuff I collected" page at the URL below.)

I don't play a lot of games, but I play Bombdown. (I only had a demo version before, now I have the full feature version). It's a great game.

CU Mathy van Nisselroy

PS check out the ABBUC site (in German only unfortunately) at http://www.abbuc.de

Source record: 32614

```
Shawn.
There were some different picture formats, and I don't remember
them.
the .pic files were 8192 byte straight screen memory data, very
easy to load.
Back when I did the following to load a .pic file:
2 DIM FILE$(18)
3 ? "INPUT FILESPEC. EG D:CYBIL.PIC":INPUT FILE$
10 GRAPHICS 9
12 CLOSE #1:OPEN #1,4,0,FILE$
20 LSCR=PEEK(88):HSCR=PEEK(89)
30 IOCB=848
100 POKE IOCB+2,7
110 POKE IOCB+4,LSCR:POKE IOCB+5,HSCR
120 POKE IOCB+8,0:POKE IOCB+9,32
130 X=USR(ADR("hhh*LVd"),16)
140 CLOSE #1
150 GOTO 150

(the * and 'd' are inverse).
all it does is load 8192 bytes at screen memory, first set to graphics 9.

I worked with Charles Marslette's assembler code to read/write
A8 dbl dens sectors.
You can set the PC controller to the parameters of a A8 disk,
then read/write the disk.
This doesn't answer the hardware question of the use of the
timing hole. One thing, you can't use the flip side of a disk
in a PC, which I guess has to do with the timing hole.
I looked back at that assembler code, it is straight forward to
set the bytes/sector, tracks/disk.
All I can say is the PC can do it, regardless of the timing hole.
I bet Rick Cortese knows more about the hardware.

Well,
when I arrived at home I suddenly realised, that there was/is a third + well known sound upgrade for your atari. It is called "get & destroy those Commodores". Doesn`t sound serious - ok, I mean you can rip off a SID sound chip of a C64 or C128 computer and install it into your Atari. I have not seen any schematics yet, but I know there are programs from Poland, that support it. At least there is SI (system info from Draco) plus a few other programs, that do check if a SID upgrade is avaiable inside your Atari.

Of course there are hundreds of SID sounds flying around the net and you can also find lots of them burned onto CD-ROM (for original C64 or its emulators). so maybe someone is willing to code a SID player for SID enhanced Ataris - or maybe someone already did. At last you have a reason to "kill those commodores", not only because you do not like them, but because you need their sound chip. Hope, this way a lot of Commies get killed... -Andreas.

P.S.: Atari sound upgrades: 1) second Pokey / Gumby
2) Covox enhancement 3) SID enhancement
4) other sound chip enhancements (Amy is a dream!)
5) any sound cards from the PC...

Well,
it is possible to enhance the A8 with a SID chip. I do not have the schematics (developed by TIGHT I think), but I have one or two programs, that test the existance of this chip inside your atari. Thus, if you are able to enhance your A8 with a SID chip, you would merely need a SID sound player program to playback these SID sounds, I guess...
-Andreas.

I doubt that it would be possible to make a workable SSH client. SSH is fairly computation-intense, and to make matters worse the algorithms are really optimized for big-endian machines. Little-endian machines like the 6502 don't do very well with them. Veryveryfast little-endian machines can run the code anyway, but the 1.7Mhz 6502 (assuming you shut off Antic) would choke on it.

I used SSH for a while on an HP9000/800 (little-endian) minicomputer from
1986 and it was very painful. If the Atari has enough RAM, it would be possible but not practical.

Perhaps an embedded Linux box plugged into the Atari to do the encryption....you could use the Atari as a smart terminal. That is the only way I see it working.

Yeah. Synapse made it near the end of their life cycle about the time
of the merger/buyout with Broderbund. They sold it as a book/disk combo
and as a fancy package with some sort of biofeedback hardware.

I have the book/disk somewhere, and a catalog with the hardware and
prices. I'll see if I can find it.

Yes,
you are right. what Lance has is a test card. I know, because I also have this test platine, made by atari. It can be described as a sort of ROM emulator, but it worked with eproms (and maybe flashroms also) and consisted of 2 platines which were combined with a small cable. You could then easily plug this test platine into you A8 and test any game on an eprom. Think atari did this before the games were manufactured as ROMs. By the way, the test platine could hold eproms of up to 1 Megabit (128kbytes) and as far as I know (afaik) Commando is just such a Megabit cart... -Andreas.

Well,
ask ABBUC (Germany) for SIO cables to connect your floppy to the A8.
they take 14DM (not sure about the Euros) for one SIO cable, since they
are getting harder to find these days. As for your 5,25" PC floppy, look
out for them at the flea markets and as soon as you found one, use
Ataridsk by HiasSoft to convert files from PC to 5,25" disk (will be
formatted in 180k Atari format then, so you also need a DD atari floppy
drive). -andreas.

Well,
this one meg means here "1 Megabit" or 128kbytes. That was the ROM or
eprom standard at that time. And if you look at some of your XE carts,
you will find out, that there are already some 128k carts. Think they
were very expensive to produce at these days and Atari did not sell
enough of them (they did cost 25 bucks in the US, 50-60DM in Germany,
10-15 pounds in UK), so they gave up producing these 1Mbit carts...
-Andreas.

7259. Re: Back after 13 years! What to do with 320Kb RAM?

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-14 19:16:57 UTC
From: Andreas Magenheimer <magea000@mail.uni-mainz.de>
Message-ID: <3C1A5029.90DD8559@mail.uni-mainz.de>
Source record: 32629

Well,
play T-34 (a polish tank battle game) for example, which merely works with 128k RAM. See dozens of polish demos, that need at least 128k or more RAM (Vent, Vengeance, Revenge of Hacker, Trip 6, Journey, X-Demo, Tit-Demo, Khai-Et, impossible but Real, Total Dazed, etc., etc.). You can also play the Brundles from KE-Soft with Ramdisk, thus there is no need to later load the levels from disk. Or play A.R. the Dungeon with 128k RAM and the main program will always be there instantly (instead of loading from disk). Or use a text editor or word processor, a databank and lots of other programs that support extra ram.

I mostly watch demos with my extra ram and use sector copiers and file managers to copy files or whole disks much faster. No need to be a disk-jockey with most sector copiers for example... And finally you may use your extra ram for programming or for storing the source codes there before you save it to disk...
Well, if you still do not know how to use your extra ram, then sell your computer to anyone else, who knows whats it good for... -Andreas.

Source record: 32631

Well,
with diskcommunicator it should be easy- but i have not tried it yet
with sector skewing (since I do not have any US doubler). thus, e-mail
me to get an ATR version of MyDOS 4.53 (3 digits) and spartaDos 3.2 f, g
and gx (the FTE shareware versions). -Andreas.

Message-ID: <3C1A530C.8607538A@mail.uni-mainz.de>
Source record: 32632

Well,
both miner and BB work well on my 320k XL computer. have not tested them
yet with my 128k XE`s. that "Peyote Pete" looks like a pirate copy from
Chile (or another spanish speaking country). You know, hackers/crackers
love to change (or completely remove) names, copyrights and such...
-Andreas.

Ron Hamilton schrieb:

From: Andreas Magenheimer <magea000@mail.uni-mainz.de>
Message-ID: <3C1A5412.D1D88354@mail.uni-mainz.de>
Source record: 32633

Well,
space Invaders, Pole Position, Pacman (or MS Pacman, Miss, not
microsoft) and a few others were also released as XEGS carts. Star
Raider(s) was also released as a (defective/incomplete) XL cart. Meaning
star Raiders also appeared with an A5 size XL box, an A5 size XEGS
manual and an incomplete XL style cart (the cart has only one chip of
4kbytes, the other chip is missing). -Andreas.

Haywood Ubeegoode schrieb:

7264. Re: DUP.SYS location

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-14 19:36:18 UTC
From: Andreas Magenheimer <magea000@mail.uni-mainz.de>
Message-ID: <3C1A54B2.FC6F2A76@mail.uni-mainz.de>
Source record: 32634

Well,
use option "O" (o, not zero) with no drive ID to setup the DOS and
Ramdisk; when done save DOS+DUP with these settings again to disk. The
next time you boot MyDOS with a Ramdisk driver, it should install the
Ramdisk and load DUP.SYS off of the Ramdisk... -Andreas.

John McCulloch schrieb:
>
> I've now got MYDOS 4.5 and can't get it to look in the ramdisk for DUP.SYS.

Source record: 32635

Well,
at least your JPG-Viewer supports the ramdisk, when it is there. Since I
merely use one drive with my computer, it would be difficult to convert
JPG to HIP, since the converter instantly loads and saves. Thus I use
drive one as the source (for JPG pics) and drive 8 / the Ramdisk as the
target (for the HIP pics).
No disk-swapping or second physical drive needed then. -Andreas.

Well,
unfortunately all abbuc articles are german !! I have asked Wolfgang
several times to allow some articles in english, but he rejected it,
since most members of ABBUC are german and do not want to read english
articles. only the disk, that comes with the paper mag has english
articles from time to time... (mostly docs).
-Andreas.

I have a non working 1050 disk drive that I am pretty sure the only thing
REALLY wrong with it, is the drive belt is broken. I don't know if the
mech has the part you are interested in, but I would be willing to sell
the whole thing for 10 dollars plus shipping. I live in Canada though.
However, I can take a US cheque (check)...

Email me if interested.

Willy

Looks like my oldes one is -you guessed it- on c.s.a.8 (1996/10/07)... when I screwed up trying to install a memory expansion on my 800XL. Several months later I discovered what had gone wrong (a solder drop in a very inadequate place).

I'm searching again, because I know I posted a few questions about a year before that...

Just found my "ATARI controller notes" and "ATARI joystick miscellany" posts
from 31 Jan 1996...

The only thing I posted before that was my 7-part parody "ST8" on
rec.arts.startrek.misc, from 25 Jan 1996...

I remember I used a mail2news gate server to post all that stuff... but I
couldn't actually read the NGs. I relied on the mailing lists that delivered
digests from those NGs...

My Percoms also respond to those same SIO commands and do fine with real Ataris and 1050s, but something about them interferes with that SIO2PC cable...

I also suspect that the 810 is totally interchangeable with 1050s, but the possibility does exist that it is *not* electrically identical.

Omnimon XL has a ROM OS similar to the XL with many JMP vectors matching the original 800 for software compatibility. I have never seen any documented PEEKs to identify it, but the default blue screen is slightly darker.

Easiest is a Select+Reset to see if you are presented with the Omnimon prompt and registers status display. The switch was normally user preference oriented, so it might be up-down or left-right on the back, side or top of the case. I put mine on the back with 'left' for stock and 'right' toward the function leys for the OS which responded to them. It was also user choice what, if anything, to put in the third OS socket.

Are you sure you didn't switch names or ISP? I started posting from Waffle
boards, Stainless Steel, Mocten, one or two others I can't remember.

I finally gave up with 30 minute time limits and busy signals and switched
over to Portal. I can find my Portal stuff fairly easily, the Waffle ones
are kind of hard to pull up.

MyDos should do the same with either OS as it is totally compatible with
800s and XL/XEs. That is why I prefer it since I can use (differently
configured) XE type or Axlon ramdisks on any of my A8s with any drive
configuration. Only shortcoming is it does not see directory listings for
files out in that enhanced portion of 1050 disks just like 2.0...

Perhaps it would be realistic to scan and translate the articles. Every year, the language translation programs get better and better, especially as you build up dictionaries of special terms, as we would need for computer articles. Maybe with a cooperative group effort -- one person doing one article? Just a thought.

: > 44mb until I could determine if the 200mb would use the 20 plus 44 and
: > 88mb carts I have; as I only have 2 or 3 of the 200mb carts.
: >

: Yes, I have used the 200mb Syquest with BB on Atari. The 44 and 88 carts
: are both supposed to work in that drive, but with our 'autoset' bug, the
: only way it would work for us would be to spend a few days partitioning,
: formatting, and then testing to the end of guessed at partitions until you
: fall off the edge of the world. Don't know if head one is used all the way
: to cylinder 2260 and head two takes over from there or not. Only way to
: find out for sure is to dive in, which is why I haven't done it yet.

: To scope mine out at first go round, I set it up as U#1,lun0 with a 17
: sector gap at the front so I could then use it as first hard drive and
: just fill in the configuration data and controller list when I finally
: make the move to put it on line for good. I haven't done that yet either
: as you kind of caught me in the middle of moving to a new Atari hard drive.

If anyone is interested, I have 3 44 meg Syquest disks, I would sell for
say $5 plus shipping .....

email me if interested...

Hi Russ,

> I worked with Charles Marslette's assembler code to read/write
>A8 dbl dens sectors.

Is this code available on the 'net anywhere, would be interesting to look at?

> This doesn't answer the hardware question of the use of the
>timing hole. One thing, you can't use the flip side of a disk
>in a PC, which I guess has to do with the timing hole.

Sounds highly likely, unless you were to punch a hole in the discs' jacket at the right point the PC wouldn't "see" the timing hole and would simply ignore the disc. Or more to the point, the FDC would report an error.

> I looked back at that assembler code, it is straight forward
>to set the bytes/sector, tracks/disk.

Is it using the "track at once" commands or is the FDC somehow able to read/write individual sectors?

Interesting, do you know whether the SIO2PC cable has problems with other third party drives like the Indus GT, or is the incomapatability limited to Percoms?

> I also suspect that the 810 is totally interchangeable with
>1050s....

Completely, I used a mixture of 810's and 1050s on my Ataris for many years without a single problem.

>....but the possibility does exist that it is *not*
>electrically identical.

Hmm, it's been *QUITE* a few years since I saw the 1050 schematic (I have the 810 field service manual but don't have my own copy of the 1050 one) but AFAIR the interface to the SIO bus is identical to that of the 810.

> "ColrView", would display it in the 8-, 64-, or 4096- ture-color glory.)

I'll have to look that up some time.

> Ack. I have no way of getting this to my Lynx. I also have no
> usable Lynx emulator. (The Linux port of Handy is ancient, last I
checked!
> GRARRGH!)

Urgh! Well it doesn't really work on the current version of Handy anyway,
the colors are wrong and it will obviously flicker a lot. The author of
Handy might fix this, though.

> Any chance you can take a digital photo or two of this?

No sorry, I'm still waiting for digital cameras to rival my regular one at
an acceptable price :^)

> Or perhaps stick
> your Lynx on a flatbed scanner and get a scan?

Just tried that. Totally doesn't work :^(The display is scanned totally
black with only scratches and fingerprints.

Here's an almost exact Photoshop simulation (just by looking at it) of the
result:

The original:
http://www.planet.nl/~mpolle/panorama.bmp

On the Lynx:
http://www.planet.nl/~mpolle/panorama2.bmp

> Now you can make a Lynx ROM with all of your family photos to show off
> in full color! :)

Heh :^)

> : This is so much fun :^)
> It rules, huh? TAKE THAT, NINTENDO! ;)

Yeah, fun-wise I'm still enjoying my Lynx a lot more than my GBA (haven't touched that one in months).

> : The software I've made to convert truecolor images to this mode was made
> : with the AmigaDE (new upcoming Amiga OS), but I will see if I can port it to
> : a simple DOS utility.
>
> *cough* Linux, too? ;)

I guess I might be able to make it into some generic sourcecode some day. Or maybe Bjoern will, he also has this routine working, as well as the 16-color-per-scanline trick.

> : I'll see if I can convert some more photos, I've been collecting a lot of
> : them on the internet today ;^)
>

Oh, okay, I thought I might have another Lynx-first that way ;^)

7304. Max SIO Speed

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-17 10:31:18 UTC
From: llpwhite@cs.com
Message-ID: <20011217053118.08567.00000661@mb-mu.news.cs.com>
Source record: 32478

With the possible U.S. release of the SIO2IDE interface, the question of SIO speed comes up again. For U.S. drives with a CPU operating at 1 MHz, the fastest that I am aware of is ~52-55 Kbs, or roughly 3 times stock. The Indus (Z80 processor@ 4 MHz, I think) supposedly operates at ~70 Kbs although my experience with "Synchromesh" is that it does not work very reliably. Some European drives are listed even higher. I always assumed that the limiting factor would be the 1 MHz processor speed in the drive? And perhaps the European drives have a faster processor in them? So here are the questions:

What is the limiting factor for SIO speed?
Can a maximum speed be calculated?
What speed is "APE WARP"?
What would it take to "ramp up" the SIO burst speed to be able to take advantage of a hard drive?

Andreas,
Space Invaders, Pole Position, MS Pacman:
Not too concerned with the boxes. Are the cases plastic or metal? Are the labels silver or XE blue? Think I've seen Pole Pos and Ms Pacman in a grey plastic case but not Space Invaders.

The Star Raiders mistake is interesting (to collectors). What kind of case/label does it have? Have only seen brown label Star Raiders.

Thanks

Hello all,

Just discovered this newsgroup and i have a question:

I used to own an Atari 800XL and had a game on that machine which i don't know the name of anymore...

It was a "Flight-Sim" alike game, in which you hoovered over mountains with your space craft, seeking stranded astronauts. Once in a while, the guy you were suppose to pick up wasn't an astronaut, but an alien which tried to smash your space craft, you had to shoot it down quickly...

Anybode remembers this one and most important: do you have a name to go with this game???

Thanks in advance!
Ferry.

7313. Atari Upgrade help

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-17 20:49:32 UTC
From: Mopar Man <nospam@nowhere.com>
Message-ID: <ueks1ukujno1t20mtij86egi9sg495gpaq@4ax.com>
Source record: 32487

I was cleaning off my workbench the other day, and came across 8 256K RAMs I bought years ago to upgrade my Atari. Since I've recently hooked up my Atari 8-bit again, I think it is finally time to do some modifications. I plan on building an SIO2PC cable, doing the "Super Video" upgrade, a 256K upgrade, and possibly building the IBM PC keyboard interface (always hated the 130XE keyboard). Problem is, I don't know which machine to modify. I have a pristine 130XE which I was hoping to keep all original. I also have several 800XLs that I wouldn't mind tearing into. From what I have read though, the extended memory 800XLs are not fully compatible with the 320K 130XE machines.

Which machine would you guys recommend doing these upgrades to?

Oh yeah - one last question. I've read the SIO2PC instructions, and can't decide on the 1 chip or 2 chip design. I'm assuming the 2 chip design should be used, as I will have my 1050 drive "in the loop" until I get all my software transferred over to PC.

Thanks for any input.

Stephen Anderson (obvious SPAM guard in place)

7314. Re: Reading Atari Disks (810) with a PC-drive

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-18 01:14:46 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <aMwT7.9813$O7.1089545@newsread2.prod.itd.earthlink.net>
Source record: 32488

I don't have any SIO2PC experience with any drive other than the Percoms.

In previous years, I used 810s, 1050s, Percoms, an Indus and the ATR8000 flawlessly with real Atari 8-bits. The possibility still exists that one of them might miss by a pico farad or two on a device such as the 10502PC cable... if it was reverse engineered by measurements from a small number of 1050 drives.

7316. "Easier EasyFind"

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-18 01:58:07 UTC
From: llpwhite@cs.com
Message-ID: <20011217205807.11381.00000938@mb-fh.news.cs.com>
Source record: 32490

Here's an idea for those of you who use EasyFind *and* an IBM/MAC PC. I've used EasyFind for years, but whenever you search for an article, author, etc, EF has to serially go through the yearly databases trying to find a match. Sometimes that's a pain. So I copied with append all of the all of the yearly databases (Antic, Analog, Compute!) into 3 composite bases, and converted the char 155 to 10/13 Ascii, and moved these to my PC. Now I can load the databases into WORD and use the FIND function to search the database instantly. This really saves a LOT of time.

I'm still a MyUTIL user, I still haven't tried out SIO2PC or APE-type tools.
If you've got a compatible 5.25" drive in a PC, MyUTIL works great.

An unmodified 1050 only does "enhanced/dual" density though (128K), not true
double density (180K), so it wouldn't be sufficient for use with MyUTIL.

The 1 chip is easier to build. I think the 2 chip may be a little
more reliable. With the diode on the 1 chip, there shouldn't
be a problem with hooking thru a drive.
I'd use the 800XL for the upgrades. The 130XE doesn't have
sockets, and I believe is not as sturdily built as the 800XL.
I don't know what compatibility you're looking for with a 320k
130XE. RAMdisks? That's about all you can use the extra
RAM for, maybe a few demos and other programs.
I have a 256k Newell 800XL. I don't like it because it has
to be shut down for about 20 seconds for a reboot after a crash
(I seem to crash fairly often when I program.)

Source record: 32496

Hello fellow 8bitters. It's been a very long time since I've been on the news groups... as you can see from my Tag line which is about 8 years old.

Anyhow, I happen to have a fully working Atari 1450XL motherboard. This is the combined 1400 and 1450 Tong board variant which accepts the floppy daughtercard. Has built in modem, speech etc.. This board works fine and I have in fact used it on several occasions to play games and do some reverse engineering work on it.

I'm putting this up for sale on Ebay in the near future but before I do I was wondering if there is even a market for such a thing anymore. I happen to have some other old prototypes that I'd like to sell off as well.

I'm dying to get me a different used car so this goes in the Toyota Supra/MR2/Corolla GT-S fund.

If there is any interested please email me... heck email an offer!

Karl

I am looking to get shot of my atari gear, preferably b4 xmas

I am selling the following

over 230 cassette games (90+full price and 140+budget titles), this is going for 180pounds

Rare GEC cassette adapter for 10-15pound

Indus GT drive (drive only, no cables, psu or manuals) this is going for 70pounds

Buyer must collect or pay for delivery

please call me (do not email, that is DO NOT EMAIL) call me on 0207 278 4244 (+44 for outside UK), ask for carmel

yours atarily

>
> What is the limiting factor for SIO speed?

The most limiting factor of standard disk SIO is the way its timed. At
about 56k your
spending as much time between packet transfers as you are on actually sending
data,
possibly a little more if the packets are only 128 bytes.

Above that only the in-packet time shrinks and returns diminish
signifigantly even at
256 bytes per packet. If you were able to unload POKEY fast enough, and use a
compatible
serial clock, you should be able to accomplish 90kbps or so on streaming data.

I dont even know if the external serial clock feature on POKEY even works,
but if it did you
wouldnt have to worry about getting real close with the sending clock.

Howdy Mopar man

Have a look at http://www.holyoak.com/atari/ and click on 400/800/XL/XE.
Then click on my schematics for the 1MB upgrade.

Maybe you can use it as a way to make any 320kB Atari 130XE compatible.
(you'll need a CO25953 to do so.)
Use pins 6 and 7 (or if that's the OS pin, use 6 and 0) and look at my site
http://www-users.rwth-aachen.de/mathy.van_nisselroy click on stuff I
collected and check out Lee Barnes' MyDOS patch. After the Patch, MyDOS
will recognise ANY ramdisk using the standard address. (most do, except the
MegaRAM III upgrade from Germany)

I found I still have the demo. It does flicker on handy but not on real lynx.
But I don't want to post it without permission. It's a demo from Duranik (long time ago).
I don't think though that your demo is significantly different.

Now only if someone could use this in a new game... I completed the 3d raycaster
on the lynx but missing are still enemies/objects (runs at 20fps). I couldn't find the
time to implement this. It's lots of work in ASM...

What exactly does Lee mean by, "MyDOS 4.50 and above (4.5x) does not do
BASIC with a ramdisk."?

I have used 4.53/4 with D8 or D9 ramdisks seemingly fine with or w/o
Basic... I normally boot w/o and load an .exe of Basic so I can load
Assembler or TextPro later and not reboot.

Russ;
You need a cold start reboot switch or Omnimon and XL-Boss type OS which
give access to 580 or similar RAM to cause a restart.

You could send the demo to me privatly (remove spamsux from my adress) and I could put it on my website and add a link here. There doesn't seem to be anything left of Duranik, so I'm sure they wouldn't mind, it's only a demo anyway.

I can imagine. Enemies would have to be clipped against the walls, don't know how hard that would be on the Lynx. Maybe you could use the ASM code you have in CC65 and do the enemy AI in C ?

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

7340. Name That Game(s) Again

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-19 03:09:40 UTC
From: Harvey Kennett <hkennett@easynet.co.uk>
Message-ID: <iyTT7.1695$8%.708908@monolith.news.easynet.net>
Source record: 32512

Hi,

Having discovered that there are Atari Emulators out there, I had a nostalgic trip today remembering the games I used to play, but for the life of me, I cannot recall their names.

1
***
The basic idea was that you had to run around a series of chambers or rooms, planting a seed, which then grew.
I am sure that there was a "Tree of Wisdom" or "Tree of Life" somewhere in a random chamber. I seem to recall that finding it was a Big Deal. I remember having to fight various creatures along the way.

The most unusual part of the game was when I finally managed to complete it.

It revealed various information about the Illuminati or Kabbala, I think, which I believe was part of the games occult flavour.

2
***
You had this helicopter that you had to fly around underground caverns and pick up stranded men, and eventually blow up a nuclear reactor core. I think it had Apocalypse in its title. Very addictive and good fun !

3
***
You had these Godzilla like dinosaurs who destroyed a city or something. The word "Chomp" keeps springing to mind.

4
***
A double cassette box, with two tapes inside. The game was an RPG. I'm sure the title had the word "Dungeon" inside.
I seem to recall fighting lots of vampires.

Any help would be much appreciated !

I live in the UK, if that has any bearing on what games we would have had over here.

Regards,

Harvey

On a real Atari with an unpatched version of any MyDOS 4.50 and above,
ramdisk won't work while you have BASIC rom on. Try booting with BASIC on
and running any ramdisk.com you like to format and load your ramdisk while
BASIC rom is on. Or do it manually, garbage or nothing is what you'll get
for a ramdisk. Or BASIC is now off, the patch fixes all that.

Loading an image file (.exe) of BASIC rom with init and run addresses
appended would be considered a very decent workaround in my book. Do you
ever run into troubles with that method? As setting $03F0 to zero and
pressing RESET causes lock up in MyDOS but allows BASIC rom to work in
SpartaDOS. I assumed page zero conflicts with MyDOS and BASIC caused
the lock up. Seems like .exe method should have troubles too...will have
to investigate some more as lock up might just be specific to my machine
set up.

Hi Aaron,

Thanks for dropping by

1...Nope..wasn't necromancer...I had that game in my collection. What a frantic game it was !

I'm trying to recall bits about mystery game number 1 that might help identify it.
I seem to recall monsters attacking you as you made your way from chamber to chamber in a Knightlore type game.
The Chimera was especially dangerous.
You had a gun, but only limited bullets.
I recall having to revist the seeds I planted after some time had passed to get something useful during the game.
The number 255 seemed important too.

2. YES! Fort Apocalypse ! Thank you !
<cue round of applause>

3. No...unless the game had different names due to localisation. Can't remember anything else about it.

4. Alternate Reality....hmm...doesn't seem to ring any bells.

Hey...anyone remember "Caverns of Khafka" ? That was an infuriating game...but very challenging.

Best Regards,

Harvey

On tape ???? I don't think that would be possible. Probably not Temple of
Apshai, but I think it's an Epyx title. Cant remember the names of the old
ones, but Starfire Warrior I think was one, Rescue at Rigel or something,
Morloc's Tower was a Dunjonquest game. I think it's one of the older basic
ones.

You wimp ;-) I played that for months. Sometimes almost days without
sleeping. That is one my all time fave games.

7352. Atari 65XE Problem

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-19 18:19:26 UTC
From: jboleman@andersencorp.com
Message-ID: <fb471e6b.0112191019.42dd6907@posting.google.com>
Source record: 32526

I just purchased an Arcade Version Medallist Electronic Dart Board game for next to nothing, since it was not working properly. It is controlled by an Atari 65XE. I am able to turn everything on, but all I get is a self test, which seems to run fine, but just keeps looping through without loading the program on cartridge. I don't have a keyboard for the thing, so I can't break out of the loop and look into things (perhaps that is my next step). The motherboard is getting proper power and the video, ram, and sound tests seem to do fine. When I unplug the cartridge, it still does the same thing. I have reseeded the cartridge and blown out the dust (there actually wasn't much), but it still does the same thing. I am wondering if the contacts are bad on there, but the do not show any sign of build up and the board, slot, and cartridge look clean. I have also unplugged the I/O devices going to and from the board to eliminate them from the equation. I am wondering if there is a hardware problem that the test won't pass, but it doesn't show anything. ANY SUGGESTIONS???

Thanks, Harvey. Great site indeed. I haven't been using my old XL for 10 years, actually. Yesterday I found this newsgroup and was excited, there are still Atari lovers.
I found old invoices in my drawer: 1986 I paid for 800XL 115 USD, casette player 45 USD and later 187 USD for 1050 drive. Total 347 USD was an average half-a-year salary those days in Poland (where I live).... Now it's better :-) Do you remember, how much did you pay for your Ataris?
Robert

Disassemble the cartridge and use a clean pencil eraser to remove
any gunk from the cartridge contacts. The 'smear free' type of
erasers will do a nice job of removing any built up gunk without
damaging the contacts.

If that fails use some non-conductive non-corrosive spray contact
cleaner in the cartridge slot. I recall having a few cans of this at one
time when we owned a few arcade machines, we used it to clean off
the joystick contacts on games that would get carbon buildup.

Steve

7357. MYDOS 4.?

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-19 23:11:30 UTC
From: John McCulloch <mcculloch@accesstoledo.com>
Message-ID: <C89U7.226406$tf5.15530840@bin5.nnrp.aus1.giganews.com>
Source record: 32531

As others on the ng can attest, I'm having a hard time finding a MYDOS version above 4.1 that supports 256K with ramdisk, DUP.SYS and MEM.SAV as it did in 4.1. A gracious soul on the ng has been trying to get 4.53 working right with ramdisk and all and I've been helping as a tester. My question is: what would 4.5x get me that 4.1 doesn't. I'd like to start using large ATRs, but I was waiting for a working version of 4.5x. Will 4.1 support 16Meg drives? If so, unless someone suggests differently, I can't see a reason to use anything higher than 4.1. The drive size support is the key.

Thanks,
John

No kidding? I remember my wonderful Mom dropping about $400 USD on a
1050 floppy drive. It was one of the best birthday presents ever. It
sounds crazy compared to today's prices, but Buddy, it was worth every
penny back then. Seems like later in the 1980's, we got another 800XL,
complete with the "Official Home Computer of the 1984 Olympics" sticker,
for about $100 or so.

Let's see, it was 1983 and I was stationed at Sembach Germany in the US Air Force. I bought an 800XL for $325 (US) and a 1050 for $375 (US). These were purchased through the Base Exchange (BX). I used a 13 inch Panasonic color television that I bought off of one of my roommates for $25.00.

$725 and no software other than DOS 3.

All MyDOS versions starting with a 4 (maybe even sooner) support 16MB.
What 4.53/3 has over other versions is that it will:

a) use 3 digit sector numbers when possible, and 4 or 5 digit numbers only
if needed.
b) if you want a file to automatically run at boot up, you no longer have to
use AUTORUN.SYS and append everything to it. You can rename the first one
you want to run automatically to *.AR0, the second to *.AR1 etc., up to
*.AR9 eliminating all the disadvantages of appending files.

This is going to no doubt touch off a flame war, but I have my analysis of
ANTIC vs. VIC-II on

http://www.armory.com/%7Espectre/tech.html

where I think the C64's VIC-II edges out the Atari's ANTIC (scroll down
about halfway to the Atari section for my justification). However, the
Atari systems do have the advantage of an MFM disk format and a faster CPU,
which I do find most gratifying. POKEY vs. SID, though, is no contest, but
the POKEY is much better than a Spectrum AY ;-)

>Can I write out 5.25" disks using a PC for either?

Not Commodore format disks, unless you have a 1541 drive connected over
the parallel port: PC FDCs are too stupid to understand GCR. I'll let the
Atari folks answer that question for their platform.

Patterson <blake@blakespot.com> writes
>Can I write out 5.25" disks using a PC for either?

The C64 had longer development, games were still being produced
commercially in the early 90s, but the Atari is a more usable and
technically interesting machine, given the relative age of the hardware
(the C64 was released 3 years later). Generally, I find C64 games to be
a little nicer, but Atari demos completely wipe the floor with the C64
except perhaps for music.

Both computers are relatively cheap, why not get both :)

And whilst you can't use a PC disk drive, I believe both systems
(definitely the Atari) have custom serial cables and software to allow
disk images to be written to the original disk drive - as both used
drives that were in effect serial devices with their own little
computers inside.

I am looking to get this game on my PC. I have the original but do not know how to get it from the cassette to the PC. (if possible) I would like to download if possible but will try to convert myself with any help info. I'd need to know exactly what I would need. I have a link in case there is a question on what game I am talking about. Seems to be very rare.
http://timeline.99er.net/enc_g.htm
Please help me. Thanks to any and all who respond.

It's most likely just a basic program, worst case- it could also have a data
file or two. You could either use an sio2pc cable to save it to a PC or ATR
or you could find the wav2cas program, record the tape on your PC with
something like cooledit and convert it to a virtual cassette. If you record
it use a high sample rate like 41100.
Some of these are difficult to convert to disk programs unless you know how
the program works. If you need the wav2cas or data file transfer programs
let me know and I'll email 'em to you.

[Nods] StarCommander for the C64, with an XE1541 (or variant) cable connecting the drive to the PC parallel port. C64 format 3.5" DSDD disks for the 1581 can be read by a PC floppy drive with the right software, though.

If I want to buy on eBay an 8-bit Atari to watch demos and play games on---which is the best bet (as far as model)?? Thanks.

Any Atari demo screenshots I can be pointed to? Thanks!

Keep Looking for:

Shoel/Joyride/Sweet Illusions/Drunk Chessboard/Bobs Lands/Trip 6 and the
amazzing X-Demo From Madteam.
Those demos are just a few of the Power of the 8bit.

Im also into the C64 demo scene as well, and enjoy the Smash Design
megademos and Hitman, Taboo and others.
I too, had to weed threw Megs of Old school demos on the C64 to find a few
great ones

I think that today's superiority of C64 VIC is in the fact that it was explored (almost) down to the bone by the c64 programmers. There is not so strong scene on ATARI and there is still a lot to invent. I saw few unbeatable graphical effects on ATARI (e.g. 3d tunels) which were possible to be done so powerfully only thanx to it's linear organisation of graphic data and ammount of color shades provided by the graphic chip. I also saw a hires picture having cartoon like graphic using more than 2 colors on screen which was using combination of sprites and clever use of the graphic mode. It was really interesting.

However, I find your comparison very fair.

let's wait what atari users will release in the future... ;-)

I've got to mention Albert of Pu-239's vicpic for the VIC-20 (some example pictures were included in VIMM). The multicolour mode usually allows one background colour, one border colour which also is used as one of the multicolours and one auxillary colour set by the high nybble of the sound register. Only the fourth colour can freely be chosen for each 4x8 cell (and that is one of the eight low colours).

By raster timing or so, Albert allows changing the other three values per raster line, of which the border can be any of the eight lower colours, the background and high nybble can be any of the total 16. When you carefully select your colours, you get really nice results from this method. I think it's one of the best "tweaks" on the VIC-I, at least in later years.

That is correct.

>Does anybody know where I can obtain this chip? I only need one, but would
>order in bulk if required to get some for spares.

Well, I have a couple of STEs which I could desolder the floppy controller
off as they both have problems, obviously not realted to floppy. Email me
if you want. You could also try http://www.best-electronics-ca.com/custom-
i.htm.

The WD1772 is used in STs. In the Falcon and TT they had a chip that is
comptible to the WD except it can handle 16Mhz or even 32Mhz for HD an ED
support.

Ok... I've got a slowish Win98 machine with a parallel port. I can
hook an Atari 8-bit drive to it and bust out 5.25" disks from disk
images? What software on the PC side do I need. Can this be done w/
a C64 drive?

The Atari never got 3.5" drives, did it? On the C64, can I lay down
5.25" disk images onto 3.5" disks and have almost everything run?

It's a give and take there, the Atari had more colors and also sported a faster processor, but the 64 got more attention and some of the graphics features shine above the Atari.

If I had to choose, I would choose the 64 as it is more abundant so finding components isn't a problem, there are way more titles in the category of software, and it's a bit easier to get stuff to and from it then the Atari.

But if I was going on gee-whiz memories the Atari 800 was soooo cool, it had FOUR joystick ports and was the only machine that had Asteroids and Missile Command, not to mention the killer-ap game Star Raiders. It certainly has as nifty look to it. The 400 looked neat too.

But if you compare some of the cream of the crop games the 64 shows favor too, an excellent example is Donkey Kong both written by Atari, the 64 version shows the enhanced capabilities of the 64 VIC-II chip.

What would *I* get... I myself have both.

> What technical precondition must be fullfilled before
> trying to do so?

This is a problem because when Atari designed their disk drives, they used a nonstandard clock frequency on their floppy controller. However, it is theoretically possible to get a PC floppy controller to read Atari disks by replacing its crystal or crystal oscillator, provided that you are using an old double density (360K) 5.25" drive, NOT a high-density (1.2MB) drive.

The crystal or oscillator is typically 8.0 MHz or 24 MHz, depending on the controller chip. Replace it with an 8.33333 MHz or 25 MHz, respectively and that should do it.... theoretically.

Also, you may need to write special software to poke the drive controller into FM mode... you'd have to look at your floppy controller chipset documentation for that.

Getting software off the PC to the Atari is easy and takes just a few min if
you have the super easy to build SIO2PC. Is there a device like this for
the C64?
Another way to get the software off the PC is Null-Modem, the problem with
this on the C64 is there are no rs232 devices for it and if so where do you
get one? and term software would also be needed.

Hard drives on the C64 is a kludge in anylight, there are so many timing
problems that you must slow the HD down to 1541 speed for compatiblity with
90% of its software and partiton size is 180k (yuk) CMD has new harware
for the C64 that give 16 meg partitions and high speed but the timing
problem kicks back in, not to say there prices are way costly that Atari's
Black Box.

On The Atari we there are Lots of HD interfaces that lets you use Hard
Drives (ide/scsi/mfm) at super high speeds and no compatibility problem,
there's also Sparta dos (MS DOS CLONE) that allows 16 meg partitions.

There's also a 3 1/2 inch drives for the Black Box as an
upgrade.

I believe that it is just a 'basic' program. I have done a little research about transferring from atari to pc but all of it is for just for floppies. (as far as I can tell) Any programs and specific directions would be appreciated. I have searched high and low for this program hoping that someone had already done this for me - with no luck. I am very new to emulators but I am very computer literate so let me know what I need to know to get this done. Thanks for the help.

The info at the link sure makes it sound like a simple Basic app. How did it load? Did it self boot? Could you Break the runniing game and then List and/or Run it? If so, you could simply Save it to an .atr image over the SIO2PC or have someone dump it to disk and transfer it to a machine capable of being an A8 emulator.

> that memory, other than install a ramdisk?

My favorite uses for the extra memory is to run Paperclip 2.x. It will use 192K of extra ram as one big buffer, no banking.

Basic XE in the extend mode will use 64K.

Several of the Synapse SYN series will also use extra memory(maybe only 64K XE banks).

Another use for the ramdisk is game levels for Dandy Dungeon.

Snapshot will use 64K to let you switch between two programs running in main memory. The rest can be a shared ramdisk.

I have a picture flip demo I wrote that uses some extra ram as a ramdisk, flipping 3 pics in main memory. Mostly to show the speed of ramdisk, page flipping, and floppy.

Keyboard doesn't matter. All of the rom/ram blocks are green? May need to lift and reseat any socketed chips. Not many in an XE. Same for the chips in the software cart. The only next step is testing with another XL/XE board.

I remember I got a used Atari 800 with 810, 410 and some games and
controllers. I paid $800 for it in 1982 I think it was! I saw it running
Star Raiders and was totally hooked.

7392. BASIC Strip Poker

Hi. I wonder where can I get the BASIC version of Artworx's Strip Poker.
I saw it once when I was a child: you could hit [BREAK] and get into
the BASIC listing. I was interested in the image-displaying routines
(So I could program an image loader and don't have to play the whole
game to see those hot nude chicks :-D).

Was this version of SP ever released?
I am pretty sure this was a BASIC listing...
I searched on XLSEARCH with no results...

HELP!

7393. BIO ATTACK for the 8-bit

Hang around a bit and the FAQ will be posted here which should answer your questions.

To get you started however, an 800XL, A 130XE or XE games system (with keyboard) are proberbly what you should be looking for.

Most stuff was developed for the 64k versions of the atari with a very few later developments taking advantage of the 128k of the 130XE. Down grader disks are common for those 800 only games.

Other machines lacked memory and in the case of the US version of the 65XE the cartridge port.

You will also want a at least a standard 1050 disk drive as some later games took advantage of the extra storage capacity.

So to sum up
a stock 64k Atari, with cartridge port, and a 1050 disk drive sould be enough to cover most needs.

Problem Solved.

I figured this out on my own the night after I posted this. I took apart the cartridge (which I hesitated to do since a replacement would be hard to find, but it was easier than I thought) and found a loose connection. I squeezed the connection together and everything worked great! That still doesn't explain to me why it went into the self-test and not basic, but at least it works for now.

Before I figured this out I bid on a replacement 65XE over E-bay, which I think I will get. Then If I have problems again, I'll have spare parts.

Thanks for all of the great advice!!!

I always thought that the Atari had a lot more potential than the C-64.

I didn't see a lot of software that really took advantage of it though. As it seems to me now, the best reason to play with an Atari is to use the software that never got ported to the C-64. =)

I had friends who owned C64's and I'd say the same. Some of the Atari ports were just poorly done. For example, I remember playing Racing Destruction Set on the C64 and liking it, but the Atari version isn't very good.

I also remember my friend playing games such as Bard's Tale on the C64, where was the Atari port?

Well,
for Atari format diskkfiles use Ataridsk by HiasSoft. You then need a
5,25" PC drive and an Atari drive capable of Double Density (180k).
-Andreas

You *cannot* read a stock Atari 5.25 disk with a PC floppy unless you consider the XF551 with its double density capability as 'stock.' Proper software on the PC can read/write only an upgraded 256 byte per sector A8 disk.

Common convention of a stock Atari disk is single density 128 byte per sector, normally Dos 2.0 format.

Never actually saw that one, but a lot of Artworx titles were distributed in a protected Basic; "Monkey Math" had clear screen characters Poked into all of the variable names and used the old Poke (Peek(138)+256*Peek(139))+2,0 trick to prevent listability. It took me about 15 minutes in DiskTool to fix that.

Well,
after a few weeks of recovering my crashed harddisk, I have found some stuff, that survived the crash. Now, I do have a text for the second Pokey/Gumby upgrade (written by Chuck Steinman), a text for the covox upgrade (by Gumi/tight, text is polish, schematics are not!), an ATR image of Stereo Pokey software and an ATR image with (very few) Covox software... Since those things mentioned here were requested by someone - just e-mail me to get them. The texts can be in ASCII or ATASCII, the images in ATR, XFD or DCM format. Just tell me what you prefer...
greetings, Andreas.

P.S.: The university will close for 2 weeks, so it will take a little more than 2 weeks for me to answer... (merely have internet access at the university).

7406. Merry X-MAS !!!

There were two different graphical OS' being called GEOS. One was from Berkley Systems for the C64 and Apple][, they never did a version for the Atari 8bit which was a shame... TCS: Total Control Systems (David Sullivan) worked on the Atari 8bit Graphic OS that he also was calling GEOS and released a very early version of it which was basically an Gr. 0 Atascii graphics environment, he and I talked often and he made many wild promises of his desktop and use of 64k and above and so forth and that he ran into issues with the carts and then he faded away... (Antic was all set to do a big head to head story on Diamond vs GEOS and since TCS never delivered, they did a cover story on Diamond and included a type-in application to change the background color of the desktop) David never came through and I got more involved with Alan Reeve and Diamond which Alan worked on extensively from disk based to cartridge based, several eprom upgrades, applications and a developers kit. The later revision icons in 2.0 and higher were designed by me, done a Apple Lisa XL and null modem'd to a 130XE and ported into Micropainter and sent to Alan. Alan even approached the Tramiels to get them to include Diamond with the XE's, they turned him down and the software Publisher (can't remember their name, they did Electronic Cookbook which was a pretty good program) screwed over Alan and caused him some headaches as I recall.... I know at one point Alan and Chuck Steinman (Turbo 8/16 upgrade) were talking about doing a new graphical OS for the Turbo upgrade... this was all buzzing around in 88-89.... It would've been nice to have seen a 10th anniversary Atari 8bit in 1989 in something along the lines of a Mega ST case with Diamond onboard..... but those dreams never made it to reality :-(ahhhhh... the good old days when the 8bits were still being sold, heck when Atari was still making hardware for that matter! :-)

There are several Atari 8bit graphic OS' out on the net, I picked a copy of SAM (Screen Aided Menu) from Europe which is quite nice and I've seen some impressive screen shots of BOSS, but haven't tried it out yet.

Alan released Diamond to PD and one of these days I gotta put images of all of his disks up for people to d/l, I have every version of Diamond through its development, all of the upgrade eproms, Diamond Write, Paint and the developers kit and a bunch of other odds and ends, I'll try to make a point of getting all of that stuff up onto the website after the New Year...

> I get that feeling too. What explains all the hacker activity on the C=
> side then? Was it cheaper than the Atari back then?

I never really figured this out. The C-64 did have more vendor presence and did advertise the C-64 rather well in the early years. Atari, on the other hand, was spending millions on weird things like video game rights to movies like E.T., such investments that never had a chance to make money. Perhaps Atari just got caught up in the VCS/Colecovision/Intellivision battles, to the detriment of properly marketing their computers.

It seemed to me that the majority of people didn't really realize that Atari even had an extensive and powerful computer line, and just thought of Atari as a video game company, which is also quite unfortunate.

Strangely, though, much of the best software for the Atari computers was made by Atari, yet Commodore didn't make much software at all for their computers, and what they did make was sub-par. For some reason, software companies flocked to the C=, even though the Atari had a better foundation to start from.

C= definitely did a good job of putting out a lot of books that documented ever little register for every little chip in the C-64, I didn't see anything like that for the Atari. Part of C= doing that, I think, was simply to document what was missing from Basic 2.0, which was a lot. Since you had to POKE to do anything nice, all that stuff had to be documented. This helped ML programmers too.

Compute! magazine also fell in love with the C=, which was probably the magazine that had the largest presence back then. Why Compute! picked the C-64 over the Atari, I don't know.

Really this is all complete guesswork though. The only thing for certain is that the Atari was not used anywhere near it's potential, and the C-64 far exceeded anyone's expections.

Hi,

>> I get that feeling too. What explains all the hacker
>>activity on the C= side then? Was it cheaper than the
>>Atari back then?

In the UK certainly.

> I never really figured this out. The C-64 did have more
>vendor presence and did advertise the C-64 rather well
>in the early years....

Too true, Atari were the true masters when it came to producing great hardware
and then not marketing it properly.... :-(

> It seemed to me that the majority of people didn't really
>realize that Atari even had an extensive and powerful
>computer line, and just thought of Atari as a video game
>company, which is also quite unfortunate.

This is VERY true. When I got my first 400 in '83 Atari were mostly known for
the 2600 over here.

Most Acorn/CBM/Sinclair owners I knew had never heard of the Atari computers,
"Atari what?" was a common question. They never really shook off this image
over here, even when the ST line came out many people still considered Atari
to be a manufacturer of games machines.

> C= definitely did a good job of putting out a lot of
>books that documented ever little register for every
>little chip in the C-64, I didn't see anything like
>that for the Atari.

You obviously missed Atari's "Technical Reference Manuals" then - full circuit
diagrams, full OS listings etc etc. They were, IMHO, far better than CBMs
documentation - I had both Atari's and CBM's docs since I was an Atari user
and CBM developer (not by choice) at the time.

TTFN - Pete.

Well if you thing geos is good take a look at Atos.
It blows geos out of the water, features:

1) Lets you use any demo or intro as a screen saver!!
Not even the ST or PC can do that.

2) Works with all Atari hardware, BB, MIO and
Hard drives, Sparta dos support.

3) Lets you run files like full games and demos and then
return back to the desktop! It uses Overlays

Atos is easy to use and works great, there also another GUI Called BOSS-X
take a look at the screen shots
www.atarixle.de Both gui's are shareware.

I agree some Atari ports where poor indeed, but some C64 ports are also poor
to take a look at these 3 for exp.

1) Koronis Rift - Poor C64 conversion, Atari looks like Amiga!

2) Amaurote - Poor C64 conversion, Atari is in 3D

3) RockFord - Poor C64 conversion, Atari plays better

There are many others also, So lets not nick pick.
There are bad (poor) ports on both sides of the fence.

And then there is Rescue on Fractalus, that due to the design of most computer's graphics chips at the time, sucked on everything /but/ the Atari :)

Richard, who says in defence of the others, that the XL wasn't too hot at line graphics.

SID vs POKEY?
You better look again, there are a few music system for the Atari 8bit like Chaos Music Composer, CMC for short and the MPT - Music pro tracker. These systems have been used in 1000's of games and demos and it pushes the POKEY to SID, some even claim it better than SID. All music is done in VBI irq

Run the Bobsland demo and hear for yourself.
Im not putting down SID, I think SID is great but your comparison of out dated. While both CMC and MPT where done in the early 90's and in Software SID did it straight from the BOX..

Diamond was GEM for the 8bit! I had 2 version of it V2.0 and V3.0 I sold my Diamond Cart on Ebay after Tom Hunt Released ATOS. BOSS X looks wonderfull to, I also have GEOS for the C64 and for its release date was wonderfull but buggy. Geos would not use my 128k ramdisk :(I herd that that bug was fix'ed with a patch years later also Geos Paint was a nightmare!! You must paint with cells (yuk) The Best Desktop GUI for the Atari 8bit is ATOS then BOSS x While BOSS X has the Looks and Feel of Win 95 ATOS is the Perfect GUI.

I don't know if 4.1 is supposed to support 16Meg but when I tried it on an ATR created with Atari810, I got an error trying to init it. When I tried an 8Meg single it worked just fine. i think you need double to get 16Meg. I haven't tried a DD 8 meg yet, but I will. That will tell me if the problem is the density or the size.
If it means anything, I'm using an 800XL with 256K and a SIO cable to my WinXP machine. I'm no longer using my OmnimonXL machine as I don't know which setting is which.

Thanks,
John

Hey, what version of Ataridsk do you have?
Once I got a newer version from "Hias" himself ... version1.2/1995, english.

Why don't - all those Atari, C64 or speccy - maniacs meet together and share their experiences with Atari, Speccy & C64.

There is a party called FOR8VER organised in Slovakia where all scenes are meeting happily and we were succesful 2 times (more than 75 visitors this year, with visitors from Hungary, Poland, England, Czech Republic, Germany, and even Holland). We will organise it for the 3rd year. If you are interested to contribute to the atari, or c64 competitions (demo, music, graphics, and intro 1kb coding competitions just contact the organisers - c64 - creamd@c64.NOSPAM.sk, or atari organiser xi@napri.NOSPAM.sk (remove nospam) or speccy organiser ellvis@pobox.NOSPAM.sk. Party will take place in middle of the March/2002 and it will as every year have big-screen presentations of all 3 systems newest things as demos, and games and hardware.

have a mery Xmas and Happy new Year

Kathleen Ferrante <KMFerrante@cfl.rr.com>:
> Keep Looking for:

> Shoel/Joyride/Sweet Illusions/Drunk Chessboard/Bobs Lands/Trip 6 and
> the amazzing X-Demo From Madteam.

i've got "Drunk Chessboard" which is impressive, but i've seen a few that do most of it on the C64 (except the motion blur, but i may have a theory or two...) and "Joyride" - i like that one, not just because they've stolen and ported one of my doublefonts from the C64 (from the VSP/sideborder part of "Lethargy") and i recognise a second one but i didn't think i'd released it...!

i could sit and rattle off C64 demos in return, but i'd be here all night! =-) Suffice to say, anything by Crest, Oxyron, Reflex or Smash Designs for a starter...

> I too, had to weed threw Megs of Old school demos on the C64 to find a
> few great ones

Hmm, some of us would argue that oldschool demos are just as good and, in a few cases, better than then nuschool stuff... i'd also say that, from what i have to date, the signal to noise ratio is more favourable on the Breadbin but if anyone wants to point me to an FTP i can leech more than the 30 or so disk images i have so far from...? Oh, before i forget, i'm away from the computer for a week and a half - if anybody does post a good FTP, can they email me too please? =-)

http://www.c64.ch/ for a very good online archive of C64 demos, by the way.

(i'm using Atari800Win as an emu on a P2-350, i don't know how this is for accuracy but my poor 800XL has seen better days and has no drive.)

Good good..

As a beta person I didn't want to see un-official versions leaked or
we risk Tomek etc not bothering because he thinks he can't trust us
beta folk :-)

I think people will like the new one...Spelunker beta works again &
the nice easy load feature is great just for starters :-)

>to SID, some even claim it better than SID. All music is done in VBI irq

First, there's no trick to doing music during IRQs; C64s can do it too.

Leaving subjective assessments of music quality aside, POKEY does not have
the flexibility over synthesis that SID does. There are no ADSR envelope
controls, only a single fixed attack and decay phase and no sustain. POKEY
also has no filters, resonance, or ring modulation.

Also, look at the output waveform. POKEY does not have waveforms like SID's
triangle (~sine), sawtooth, pulse or noise, but a single decaying exponential
waveform. This strongly limits the timbre of sounds it can synthesise.

For people who contest this analysis, look at Mapping the Atari. There's
also a nice breakdown of this information on

http://www.ionpool.net/arcade/tempest_code_project/pokey_registers/pokey_registers.html

I'm not arguing with you that Ataris definitely had tools for serious music
composition. Heck, you could do reasonable music with an AY if you were
that determined. POKEY also does have some nice features that SID doesn't,
like 4-voice polyphony and that clever distortion feature. However, SID has
much more capability in regards to range and veracity of sound generation.

I remember a game called "Bio Defence" with
synthesized speech, but "Bio Attack" was most
likely not converted to the Atari.

Are there conversions for other home
computers?

Density is definitely a factor; the limitation is 16 bit forward pointer for
a maximum of 65535 sectors which is only 16MB when using 256 byte sectors.

What happens in response to Select+Reset on that XL? Unless you see the
current processor register status and a monitor prompt, you do have Omnimon
OS at that switch setting.

This is hilarious :)

My first post was on May 28th, 1992. The next day, I made my second post, in which I asked whether anyone knew the email address of Charles Marslett.

(I can't remember why I was looking for you.. I was using A65 and apparently having a problem, and the email published in the doc was bouncing.)

Man.. Where have you been lurking for 9 years??!? :))

Oh yes, back when I was looking for my first home computer (1983) a
base Atari 400 with 16K (no BASIC cartridge, not even a cassette
drive) was about $200. I used the same amout of money to Buy a
VIC-20, Datasette, and the first Compute's Gazzette. Atari had
expensive computers which at the time also required just as expensive
add-on to make them work (BASIC to program, the 850 if you wanted to
use non-Atari modems or Printers, etc.) By the time the lower cost
(added feature) Ataris came out the 8-bit market was pretty much
Commodore's.

The Atari version of the Lucasfilm games Ballblazer and Rescue on
Fractalus are definately superior to the C64 versions. I suppose it
is due in part to the fact that originally the Atari platform special
features were taken advantage of.

Wimp??? I do not think so. <g> I did play it for hours upon hour daily,
but the "daily" went on for A LONG time. It is also one of my all time
favorite games for the 8-bit along with Ballblazer, Castle Wolfenstein
and the Ultima games. I sure do long for those days again.

The US 65XE does have a cartridge port. What it does not have is the
800XL parallel bus or the 130XE extended cartridge port, so you cannot
use an MIO or Black Box. If you only want to play games and demos,
don't worry about it.

> is due in part to the fact that originally the Atari platform special
> features were taken advantage of.

In the case of Ballblazer, it's the display lists making the splitting
of the ground effect easier - Fractalus, however, is leaning on the much
faster processor - if memory serves, when an enhanced version of
Fractalus was produced for the 20MHz SuperCPU, the code was dissected
and found to be pretty inefficient in places...

The same would be true if there were attempted conversions of some of
the singing-and-dancing C64 titles like Mayhem in Monsterland or
Turrican 2 - not having the option of mixing 320x200 and 160x200 on the
same scanline would make the parallax nigh on impossible.

I would get a 130XE, but the 800XL is good also. There are some games
that do not like those and sometimes it is nice to have an old 400 or
800 around. I have all three BTW.

Disk Communicator by Bob Puff is probably the latest and easiest app for
condensing a disk full of data to a single file for transmission. Try
XLSearch or his nleaudio site; 3.2 is the newest version, I believe.
Sometimes called DCom or DisComm.

Access the menu that allows 'mounting' an image file in emulated D1: and
then perform the emulator's 'cold start' operation. Some use a menu
drop-down and others a function key combo like Shift+F5.

Message-ID: <a07okd$133$1@news.tht.net>
Source record: 32391
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

Hello.

Please forgive the crosspost, but I am not an Atari user and as such
didn't know which machine I needed.

I am in need of a WD1772 chip for a piece of equipment, and searching the
'net found that Atari's used the same chip in some hardware. So I figured
someone might know where I could go.

Does anybody know where I can obtain this chip? I only need one, but would
order in bulk if required to get some for spares.

Many thanks,
Patrick

>>it but where can i get the documents for it??

How easy was it to build? Did you make the cartridge or internal version?

Can you only use MyDOS with it? Will it work with SpartaDOS?

Is it simple to copy disk images and then boot from those images? How many images can you put on the disk without disturbing your hard-drive DOS partitions?

Thanks,

Ah yes, and the MMG Basic compiler! So there at least three BASIC
compilers out before Turbo BASIC and it's compiler came out. IMHO
Turbo BASIC & it's compiler kind of blew away plain Jane Atari BASIC
and the other compilers of the day. I had always wanted a BASIC XL/XE
compiler but OSS never made one. Turbo BASIC I suppose is on a par
with BASIC XL/XE.

These may also be used in Commodore 64 drives (1541s?)? I have heard them give
Atari ST's as a good source of cannibalizing for their floppy controllers so Atari
users should do likewise.

I'll say. Mighty nice and helpful.

Now, if those fellers could make Action! piggyback onto SpartaDOS X I'd be groovin'. I'd be groovin' a lot more if I could figure out where my Action! manual went to and why my FOR DO loops keep looping even when the condition's been met.

Hi,

It was super easy to build. Why wasn't this done 15 years ago....ohh yeah- the cost!
I built the internal version, but not exactly like the instructions say. I used a wire wrap socket and plugged it in to the rom socket,and the rom on top, so i was able to tap all the signals exept 3 which I just ran wires. this way I can put back almost all the shielding and run the IDE cable out through the parallel bus opening. this is on a 800XL by the way. I think I can put the drive inside a 1200XL. thats my next project.

The drive works perfect with MYDOS. 8-16 meg partitions. I just dont know about disk images. the driver copies the os to ram then patches it, so anything that uses that ram wont work. I dont have SpartaDOS - so i cant answer that one. I asked the author about disk images.. but he hasnt got back to me yet..I think it involved burning a patched os...(makes sense) I'll cross that road when i get there LOL!!!

As far a disk images and booting...I dont know..I think something was programmed in the rom to pick the image to boot from..and software to copy the images....

Ralph

: I've got the wrong utility.

DiskCom is for disk-images (non ATR) created on Atari 8-bit. ARC is an
archiver.

: Am I missing something? Why is arc better than than a zipped atr for
: dowloading?

If it's ARC, then there are probably Atari files into the archive, not an ATR
image. ARC is better cause you can pack/depack it on Atari 8-bit. There ever
was a world before emulators you know...

It all depends on what is in the ARChive; you will need to UNARC it to
determine that. Most emulators allow access to individual files or hard
drive subdirectories so you could copy them into an .ATR image, or use one
of the utilities from Ken Siders or others to import files into an image.

DisComm was designed to convert an entire disk into modemable files and
back; I use it often on an emulator to expand contents of a .DCM file onto a
blank .ATR image.

I've tried MyDOS 4.1 which I thought supported large ATRs since they inited, but later discovered it didn't give the whole space, only a small, diskette like portion. I tried, MyDOS 4.53 and discovered with the help of others that it didn't support MEM.SAV with my ramdisk. I tried 4.51 and my 800XL wouldn't even boot on it.

What is an emoticon for pulling my hair out? I'm so disappointed I could poo.

Here's what I ask. Before I take all of the 8-bit stuff I recently acquired and stamp it into silicon based trash I need a DOS that will:

1) Run on my 800XL with 256K forming a ramdisk of 192K.
2) Load DUP.SYS into the ramdisk on bootup with or without DOS.
3) Support MEM.SAV into the ramdisk on calling DUP.SYS.
4) Support large disks (8 or 16MB ATRs).
5) Support single and double density diskettes.
6) Read DOS 2 and 2.5 disks.

I'm I delerious? Is this totally impossible? I will personally send anyone who can send me (legally) a DOS on ATR (not those goddamned arc files) that does all these things, a check for $50. You'll have to trust me, I need the functionallity before the cash goes out. The ATR must do everything in the six items on bootup, without my having to edit source code, configure things and write DOS files or peek and poke thinks in basic.

If this is impossible, posts that state "John you're a knucklehead" are okay too and my Atari stuff can be in the trash by the new year.

an arc file has a distinct advantage to a raw .atr file.
1. it is compressed so it saves download time, disk space.
2. it has a crc in it that will tell you if it is corrupted, something
that is much more common than one might think.
a zipped .atr or an an arced atr are better ways to go.

Hello John-
>I've download arc files and can't figure out hoe to make ATR out of them. I tried DISKCOMM...<

What you need to do depends on the hardware you are using:

Are you using an Atari and modem to send/receive the files, or using email attachments on a PC? If you are using a PC, do you have APE or SIO2PC?

Likewise, are you using the disk/images with real A8 hardware or an emulator?

If we know this, then you can get more concise answers.

Regards,
Larry

Source record: 32318

Hello,

In my teenage years, I owned an Atari 800 and a 1200XL later.
I was taking a trip down nostalgia lane the other day and decided to get an emulator to run some of the software I used to run on those machines. I got xmess under Linux, got the atari os b rom and tha basic rom and I can boot the emulator just fine. I also found disk images in .atr format and I also can use them just fine. What I have not been able to find is rom images for cartridge based games I used to play (Pac Man, Centipede, Galaxian, to name a few).

I am new to emulating, but based on the basic rom, I suspect other cartridge roms would also have a .rom extension.

Can anyone tell me where to find these roms?

Thanks.

ps. I searched a few faqs and did a web search, but could find nothing.

7496. Best demo on the 8-bit

Hi,
I have seen a lot of demo's on the 800xl, but which is the best
one??.What do you think?

One that i really like is BOBS LAND.....

Also i got my hands on a 256k rambo XL, I have seen some sites with
demo's for the rambo xl, but i can't rememder where! maybe some one
can tell me(or send me some rambo demo's).

Last but not least,Happy christmas and a happy new year to all
atarian's out there.
((((My atari is now 19 years old)))

Will my PC last as long bill????

7497. looking for working Envision .ATR

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-26 02:27:01 UTC
From: ronfucci@bellsouth.net
Message-ID: <3c29336e.44170531@news.atl.bellsouth.net>
Source record: 32321

I downloaded the .ATR of envision from both the Envision site at
http://members.shaw.ca/dschebek/envision.htm and also from spudster at
ftp://ftp.spudster.org/ (envision.zip) and can't get either to work
using Atari800WinPlus3.0 or using Atari Filemanagement 1.5 connected
via a SIO2PC cable to a real 130XE.

Let me know if you get it to work.

Thanks

ron

7498. 5.25" floppy disks available

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-26 07:43:17 UTC
From: Roy G Biv <erasmus@floppy.disk.palace>
Message-ID: <Pine.GSO.4.33.0112260103140.29527-100000@shell1>
Source record: 32322

The local store in the Arvey office supplies chain has put its supply of 5.25-inch floppy disks on closeout sale. Name brand boxes of 10 disks are going for $2, and Arvey's own packs of 25 disks are going for $5. That works out to a price of 20 cents (U.S.) per disk.

I'm posting this information because some posters in recent years have indicated they can't find 5.25-inch disks in their areas anymore. I realize some people may say that they'll wait until maybe there's a firesale somewhere, sometime, where the price may be lower than this -- but that's a bunch of "ifs" strung together, whereas this is for real. 20 cents per disk was about the lowest the regular price ever got for these floppies back in the days when there were "regular" prices for them. (In contrast, in the early '80s, when I first got an 8-bit, the price was one dollar per disk, and those weren't even double-sided!)

These disks are DS-DD, meaning double-sided and double-density. I can vouch for the quality of Arvey's generic disk packages since I've been using them for the last 15 years or so. The name-brand disks are 3M and should be good, but the 3M boxes do not say "soft-sectored," which is what 8-bit Atarians would need. Back in the '80s we all used to be very careful when buying 5.25-inchers to make sure they were labeled as soft-sectored. These 3M boxes are dated 1996 and later, so I suppose the company must figure that saying "soft-sectored" isn't necessary nowadays.

Nevertheless, I'm not totally comfortable with that. I feel that all 5.25-inch floppy disk packages should say "soft-sectored," even in the 21st Century! In any case, the 3M boxes probably are soft-sectored, since hard-sectored floppies haven't been state-of-the-art for perhaps 20 years. (If you come across hard-sectored 5.25-inch floppies anywhere, that means they're formatted only for incredibly old "IBM" computers, which almost nobody uses anymore. But we Atarians probably shouldn't talk, should we!? After all, we're still using our "incredibly old" 8-bits! <grin!>)

They have both formatted and unformatted packages on sale. "For-matted" means pre-formatted for "IBM" only, so what Atarians want is the UNformatted kind. If anybody orders directly from the store, be sure to specify *unformatted* disks. This is important! For Atari 8-bit use, you want unformatted double-density floppies.

(Of course, if anybody out there has one of those "incredibly old" "IBM" computers and wants a mere double-density 5.25-inch floppy that's "IBM"-pre-formatted, they've got a bunch of boxes of those on

sale too. In addition, they also have packages of 5.25-inch high-density floppies, which can be used on more modern types of "IBM"-compatible computers. The high-density boxes and packs are available in both "IBM"-formatted and unformatted varieties. The prices on all of the varieties work out to the same 20 cents per disk.)

Soooooo.... If anybody out there is desperate for any of these 5.25-inchers, the store says they're willing to sell by mail-order. It's not usual, but they can do it. You can contact them on the phone at 513-421-5300. Shipping charges will increase the overall cost per disk, but if you can't get 'em anywhere else, what's the alternative?!

So there you have it. I hope this info is helpful. Good luck and happy formatting!

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

Definitely not 1541 - these used GCR recording with a custom chip.

Maybe the 1581 or other newer models which could do GCR as well as MFM.

They are not produced anymore - a friend got some of the last in Germany as
stock for replacements on his industrial CPU boards.

Where do you live? If in or near Germany, I should still have some that were
desoldered from old ST boards.

The only real difference in the hard sectored disks are the multiple index holes which do not matter on 810s and 1050s and most other A8 drives. Index holes *ARE* important on Percoms and many XF551s; not certain about Ranas and Traks, but Indus's which I have seen also ignored the index hole.

Formatting is definitely a non-issue; you will not find them with Atari formats, so you will need to format unformatted ones or re-format the IBM formatted ones... Either way, you will be putting new formats on all of them.

Do appreciate the heads up on availability of those kinda gettin scarce items.

I liked the MEM.SAV support. Maybe this is why the later versions of MYDOS don't support it: noone other than me seems to need it. I liked being able to leave BASIC or MAC/65 to DUP.SYS and come back to where I came from. It seems like when MYDOS started to support large disks, it dropped MEM.SAV support. I'd be willing to try SpartaDOS if it's not licensed. Is there something other than MEM.SAV support that allows "shelling" to DOS without first saving my work back to disk?
Thanks,
John

I don't know which IBM computers used hard sector floppies, but
Heath and Northstar and some word processors used them. If you find
any hard sector disks, a post in comp.os.cpm should find someone who can use
them.

7512. Atari 800 XL DOS

Hello,

I'm not new to the Atari 800 XL but it has been awhile. I had it when I was like 9. I just recently got one as a nostalgia gift and was wondering how I get an OS onto a floppy to boot it up. I actually still have some original games and want to play them. I've read tons of posts but I just don't understand. If someone could help me out I would be much obliged.

Thanx Rich

Most original game disks should boot without any other OS. Just turn on
the drive, insert the disk and then turn on the computer. For some
games on an XL/XE computer, you have to hold the OPTION key while turning
on the computer.

Spartados doesn't need mem.sav. When you type "dos", it jumps to the
command interpreter, which is already in memory. If you don't execute
any external commands, "car" takes you back to Basic, MAC65 or whatever.

Hi

Today by accident I reached Delphion, some sort of patents on-line database.
After entering "ATARI, INC." in Quick Search, I got several search results.
There are lots of Atari interesting stuff, for example

http://www.delphion.com/details?pn=USD0254544__
(Looks like a CX40 to me :-D)

http://www.delphion.com/details?pn=USD0251143__
(Heavy sixer? :-D)

Also I found the patent detail for the Atari 800 home computer,
and other interesting stuff.

It's worth the visit.

B.

Right, try SpartaDOS, if not licensed.
The FTe 'g' version is probably the one you should get.
You can find it at www.spudster.org and a lot of other places.
xd32g.atr I think.
I just spent about 1.5 hr looking for SpDOS manual or something
to help a new person to SpDOS. I give up. I did find the SpartaDOS X
manual, which would probably be ok, but not really.
I guess someone needs to make a SpDOS manual.

No, if you click the picture it opens up Acrobat. Looks like it was supposed
to be an analog joystick. Looks like it is also non functional. The basic
design has a flaw, you wouldn't be able to move the joystick from center.

Are you sure you went to the right site??? The site is 100% pure plain HTML.
No Java, no music, no flash, no nothing so I don't see a reason why it would
send cookies. It also doesn't send those as I take a look at the site myself
(and no, they're not allready on my harddisk since they'll be erased at every
reboot)...

Yes, I took http://www7.brinkster.com/atari

> The site is 100% pure plain HTML.

Maybe YOUR site is 100% HTML but the bringster server asks for cookies. If rejected one cannot get to your site, at least not with netscape I use.

> No Java, no music, no flash, no nothing so I don't see a reason why it would

Source record: 32200

```
Here's a little Sparta/FTe DOS doc I just wrote.
12/28/01
A SpartaDOS 3.2g Reference
Russ Gilbert

SpartaDOS was originally by ICD. The rights to it were
obtained by FTe (Fine Tooned Engineering). FTe released
version 3.2g as 'registerware'. Mike Hohman, owner of FTe
would send a manual for a $20 registration, he said. FTe
has disappeared. SpDOS 3.2g is freely distributable.
FTeDOS is SpartaDOS.

SpDOS has internal and external commands. When you boot
SpDOS, it has some commands available which do not require
further loading of memory and will not interfere with
whatever you have in memory. These are the internal
commands. External commands will overwrite what is in
memory, so you will need to save your work if you use an
external command. The COPY command is internal but will
wipe out program memory.

SpDOS supports subdirectories, which are specified with a
'>'. SpDOS supports time and date, will write current time
and date to the directory structure. You need to set the
TIME and DATE when you boot up, or use a R-TIME8 cartridge
to automatically set time.

FTeDOS 3.2G will not work in emulators, you need X33A or
X33B for use in emulators.

Any binary load file in current path named with a .COM
extension will load and run by just typing the filename
with or without the .COM extension. Running .EXE or
.BAT files require specifying the extension.

INTERNAL COMMANDS:

DIR- displays files on present drive in SpDOS format.
Supports sub-dir paths and wildcards (* and ?).
DIRS- displays filenames in DOS 2.5 format.
?DIR- displays the current path.
CWD- change the current path to a sub-directory.
eg. CWD D3:GAMES
CWD D3:GAMES>ARCADE
CWD < (go up one directory)
CREDIR - Creat a sub-directory
```

DELDIR - Delete and empty directory
CWD - Change Working Directory.
Dx: - Set default drive. eg. D3:
TREE - display directory tree.
CAR- leaves the command prompt and runs the cartridge.
The DOS command from BASIC will return to command
prompt.
BASIC ON- Turn internal BASIC on.
BASIC OFF- Turn internal BASIC off.
COPY - eg. COPY D1:*.* D3:GAMES>*.* Can be used to view
a file, but don't COPY to S:, copy to E: instead.
Use CNTRL-1 to stop scrolling.
ERASE - erase the file specified. Supports wildcards, so
be careful!
UNERASE - Will recover an ERASEd file if possible.
RENAME - rename a file. eg. RENAME PROG1.COM PROG2.COM
PROTECT - write protect a file.
UNPROTECT - unprotect a file.
LOCK - write protect a disk.
UNLOCK - unprotect a disk.
KEY ON, KEY OFF - turn keyboard buffer on, off. It is best to
turn KEY OFF for many binary load programs.
RUN - will exectute memory at location specified. Location
must be in hex, eg. RUN A000.
VERIFY ON, OFF - turn write verify on or off.
BOOT - write boot sectors to boot the file specified.
usually used to make a bootable disk of SpDOS.
After you copy SpDOS to a disk, you must do the
BOOT command to make the DOS boot.
eg. BOOT D1:X32G.DOS.
TIME - set the time.
DATE - set the date.

EXTERNAL COMMANDS: Any executable program is an external
command. A few come on the SpDOS disk.

MDUMP - display area of memory in hex. eg. MDUMP A000.
DUMP - display a file in hex. eg. DUMP D1:FILE.EXT
XINIT - Format a disk, SpDOS.
AINIT - Format a disk, DOS 2/2.5. Be careful, it doesn't
ask you twice if you want to format the drive.
TDLINE - puts a time/date line at top of screen.
note: CTHTDL is a replacement TDLINE that
is Y2K correct.
RDBASIC - make RAMDISK XL/XE.
RD - make ramdisk. SpDOS can probably use any RAMDISK
program you use.
CHVOL - change volume name of a disk.
CHTD - change time/date stamp of a file. eg. CHTD
FILE.EXT sets the t/d stamp to present t/d.
SCOPY - sector copy from one drive to another. Will

abort if there is a sector error. SCOPY isn't
used much, Disk Communicator is used instead
(DCOMM32.COM.)
eg. SCOPY D1: D2:
SCOPY D1: D2:FILENAME.SCP
SCOPY D2:FILENAME.SCP D3:
HDINIT and HDFMTPH - These are hard drive formatting
programs. SpDOS supports up
to 16 meg hard drives.
BATCH FILES:
A text file can be made to do any SpDOS commands or
run any external binary file. Just make the text
file with the correct syntax on each line.
STARTUP.BAT is searched for on the boot drive and
executed at boot time if found. You can run a batch
file from the command line by typing its name.
eg. KEY OFF
D1:RD.COM
COPY D3:*.* D8:
CTHTDL
CAR
Above will turn off the keyboard buffer, then establish
a RAMDISK, copy all files in the root directory of D3:
to D8:, turn on the CTHTDL time/date line, and run
the cartridge.

One more important thing about Fte/SpartaDOS.
SpDOS can read, write, erase, maybe unerase, load/run, dir, ainit MyDOS/DOS
2/2.5 disks/files. Do not try to write
the other way, with MyDOS booted to a SpDOS disk,
it will trash the disk. I don't think SpDOS understands
MyDOS subdirectories, however.

For any individual files which need a File Management System (correct designation of DOS on the A8), you must have a bootable DOS disk in order to create additional copies unless you wanted to type in a *LOT* of data statements... Maybe someone is close enough to get one to you if required.

From: Roy G Biv <erasmus@6502.chip.old.folks.home>
Message-ID: <Pine.GSO.4.33.0112272031480.23314-100000@shell1>
Source record: 32207

John McCulloch wrote in message ...
->Is there something other than MEM.SAV support that allows "shelling"
->to DOS without first saving my work back to disk?

....to which Bill Marcum (bmarcum at iglou dot com), on Thu, 27 Dec
2001 at 04:59:01 -0500, replied:
->Spartados doesn't need mem.sav. When you type "dos", it jumps to
->the command interpreter, which is already in memory. If you don't
->execute any external commands, "car" takes you back to Basic,

The same goes for DOS-XL, put out by O.S.S. It also doesn't need
a MEM.SAV file. Just like what Bill said: As long as you don't do
an external operation, you can hop back and forth between BASIC and
DOS-XL and your program will still be there.

From: Russ Gilbert <russg@en.com>
Message-ID: <3c2be356$0$35611$1dc6e903@news.corecomm.net>
Source record: 32210

I worked on the SpDOS reference some more:

12/28/01
A SpartaDOS 3.2g Reference
Russ Gilbert

SpartaDOS was originally by ICD. The rights to it were obtained by FTe (Fine Tooned Engineering). FTe released version 3.2g as 'registerware'. Mike Hohman, owner of FTe would send a manual for a $20 registration, he said. FTe has disappeared. SpDOS 3.2g is freely distributable. FTeDOS is SpartaDOS.

SpDOS has internal and external commands. When you boot SpDOS, it has some commands available which do not require further loading of memory and will not interfere with whatever you have in memory. These are the internal commands. External commands will overwrite what is in memory, so you will need to save your work if you use an external command. The COPY command is internal but will wipe out program memory.

SpDOS supports subdirectories, which are specified with a '>'. SpDOS supports time and date, will write current time and date to the directory structure. You need to set the TIME and DATE when you boot up, or use a R-TIME8 cartridge to automatically set time.

FTeDOS 3.2G will not work in emulators, you need X33A or X33B for use in emulators.

Any binary load file in current path named with a .COM extension will load and run by just typing the filename with or without the .COM extension. Running .EXE or .BAT files require specifying the extension.

FTeDOS is compatible with DOS 2/2.5 MyDOS for reading, writing, loading or erasing files on those DOSes. Do not try to read/write/load/erase FTeDOS files from the DOS 2 style DOSes. SpDOS doesn't support MyDOS subdirectories I think.

INTERNAL COMMANDS:

DIR- displays files on present drive in SpDOS format. Supports sub-dir paths and wildcards (* and ?).
DIRS- displays filenames in DOS 2.5 format.

?DIR- displays the current path.
CWD- change the current path to a sub-directory.
eg. CWD D3:GAMES
CWD D3:GAMES>ARCADE
CWD < (go up one directory)
CREDIR - Creat a sub-directory
DELDIR - Delete an empty directory
Dx: - Set default drive. eg. D3:
CAR- leaves the command prompt and runs the cartridge.
The DOS command from BASIC will return to command
prompt.
BASIC ON, OFF- Turn internal BASIC on or off.
COPY - eg. COPY D1:*.* D3:GAMES>*.* Can be used to view
a file, but don't COPY to S:, copy to E: instead.
Use CNTRL-1 to stop scrolling.
ERASE - erase the file specified. Supports wildcards, so
be careful!
RENAME - rename a file. eg. RENAME PROG1.COM PROG2.COM
PROTECT - write protect a file.
UNPROTECT - unprotect a file.
LOCK - write protect a disk.
UNLOCK - unprotect a disk.
KEY ON, KEY OFF - turn keyboard buffer on, off. It is best to
turn KEY OFF for many binary load programs.
RUN - will exectute memory at location specified. Location
must be in hex, eg. RUN E457 does a warm start. I think
RUN is an external command for some versions of SpDOS.
LOAD - Loads a binary file, but doesn't run it.
SAVE - Saves an area of memory to a file.
eg. SAVE D1:MYFILE A000 BFFF
VERIFY ON, OFF - turn write verify on or off.
BOOT - write boot sectors to boot the file specified.
usually used to make a bootable disk of SpDOS.
After you copy SpDOS to a disk, you must do the
BOOT command to make the DOS boot.
eg. BOOT D1:X32G.DOS.
TIME - set the time.
DATE - set the date.

EXTERNAL COMMANDS: Any executable program is an external
command. A few come on the SpDOS disk.

MDUMP - display area of memory in hex. eg. MDUMP A000.
DUMP - display a file in hex. eg. DUMP D1:FILE.EXT
XINIT - Format a disk, SpDOS.
UNERASE - Will recover an ERASEd file if possible.
TREE - display directory tree.
AINIT - Format a disk, DOS 2/2.5. Be careful, it doesn't
ask you twice if you want to format the drive.
TDLINE - puts a time/date line at top of screen.
note: CTHTDL is a replacement TDLINE that

is Y2K correct.
RDBASIC - make RAMDISK XL/XE.
RD - make ramdisk. SpDOS can probably use any RAMDISK
program you use.
CHVOL - change volume name of a disk.
CHTD - change time/date stamp of a file. eg. CHTD
FILE.EXT sets the t/d stamp to present t/d.
SCOPY - sector copy from one drive to another. Will
abort if there is a sector error. SCOPY isn't
used much, Disk Communicator is used instead
(DCOMM32.COM.)
eg. SCOPY D1: D2:
SCOPY D1: D2:FILENAME.SCP
SCOPY D2:FILENAME.SCP D3:
HDINIT and HDFMTPH - These are hard drive formatting
programs. SpDOS supports up
to 16 meg hard drives.
BATCH FILES:
A text file can be made to do any SpDOS commands or
run any external binary file. Just make the text
file with the correct syntax on each line.
STARTUP.BAT is searched for on the boot drive and
executed at boot time if found. You can run a batch
file from the command line by typing its name.
eg. KEY OFF
D1:RD.COM
COPY D3:*.* D8:
CTHTDL
CAR
Above will turn off the keyboard buffer, then establish
a RAMDISK, copy all files in the root directory of D3:
to D8:, turn on the CTHTDL time/date line, and run
the cartridge.

7539. FS: Atari 8-bit Cartridge EPROM's (Intel D2764)

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-28 08:24:48 UTC
From: Richard Costa <lightlore@datawest.net>
Message-ID: <u2ob5a61b2u3f0@corp.supernews.com>
Source record: 32212

I am not sure if these are worth anything to anybody, but I have 15 EPROM's I made of Atari 400/800 cartridges back in 1985 (using an EPROM burner on my Atari 800) and the EPROM's have been in this EPROM tube in my closet ever since.

They chips are labelled Intel D2764.

If anyone is interested in making me an offer send me an email, thanks.

Source record: 32214

OK, I hope this is the final version. Sorry for the bandwidth.
Actually. Someone says they're going to work on it too, and
there should be a better one soon.
12/28/01
A SpartaDOS 3.2g Reference
Russ Gilbert

SpartaDOS was originally by ICD. The rights to it were
obtained by FTe (Fine Tooned Engineering). FTe released
version 3.2g as 'registerware'. Mike Hohman, owner of FTe
would send a manual for a $20 registration, he said. FTe
has disappeared. SpDOS 3.2g is freely distributable.
FTeDOS is SpartaDOS.

SpDOS has internal and external commands. When you boot
SpDOS, it has some commands available which do not require
further loading of memory and will not interfere with
whatever you have in memory. These are the internal
commands. External commands will overwrite what is in
memory, so you will need to save your work if you use an
external command. The COPY command is internal but will
wipe out program memory.

SpDOS supports subdirectories, which are specified with a
'>'. SpDOS supports time and date, will write current time
and date to the directory structure. You need to set the
TIME and DATE when you boot up, or use a R-TIME8 cartridge
to automatically set time.

FTeDOS 3.2G will not work in emulators, you need X33A or
X33B for use in emulators.

Any binary load file in current path named with a .COM
extension will load and run by just typing the filename
with or without the .COM extension. Running .EXE or
.BAT files require specifying the extension. Note that
you have to put the period at the end of a file that
has no extension.

FTeDOS is compatible with DOS 2/2.5 MyDOS for reading,
writing, loading or erasing files on those DOSes. Do not
try to read/write/load/erase FTeDOS files from the DOS 2
style DOSes. SpDOS doesn't support MyDOS subdirectories
I think.

INTERNAL COMMANDS:

DIR- displays files on present drive in SpDOS format.
Supports sub-dir paths and wildcards (* and ?).
DIRS- displays filenames in DOS 2.5 format.
?DIR- displays the current path.
CWD- change the current path to a sub-directory.
eg. CWD D3:GAMES
CWD D3:GAMES>ARCADE
CWD < (go up one directory)
note: the command line doesn't show the current
path. You have to use the external TREE command.
CREDIR - Creat a sub-directory
DELDIR - Delete an empty directory
Dx: - Set default drive. eg. D3:
CAR- leaves the command prompt and runs the cartridge.
The DOS command from BASIC will return to command
prompt.
BASIC ON, OFF- Turn internal BASIC on or off.
COPY - eg. COPY D1:*.* D3:GAMES>*.* Can be used to view
a file, but don't COPY to S:, copy to E: instead.
Use CNTRL-1 to stop scrolling.
ERASE - erase the file specified. Supports wildcards, so
be careful!
RENAME - rename a file. eg. RENAME PROG1.COM PROG2.COM
PROTECT - write protect a file.
UNPROTECT - unprotect a file.
LOCK - write protect a disk.
UNLOCK - unprotect a disk.
KEY ON, KEY OFF - turn keyboard buffer on, off. It is best to
turn KEY OFF for many binary load programs.
RUN - will execute memory at location specified. Location
must be in hex, eg. RUN E457 does a warm start. I think
RUN is an external command for some versions of SpDOS.
LOAD - Loads a binary file, but doesn't run it.
SAVE - Saves an area of memory to a file.
eg. SAVE D1:MYFILE A000 BFFF
VERIFY ON, OFF - turn write verify on or off.
BOOT - write boot sectors to boot the file specified.
usually used to make a bootable disk of SpDOS.
After you copy SpDOS to a disk, you must do the
BOOT command to make the DOS boot.
eg. BOOT D1:X32G.DOS.
TIME - set the time.
DATE - set the date.

EXTERNAL COMMANDS: Any executable program is an external
command. A few come on the SpDOS disk.

MDUMP - display area of memory in hex. eg. MDUMP A000.
DUMP - display a file in hex. eg. DUMP D1:FILE.EXT
XINIT - Format a disk, SpDOS.
UNERASE - Will recover an ERASEd file if possible.
TREE - display directory tree.

AINIT - Format a disk, DOS 2/2.5. Be careful, it doesn't
ask you twice if you want to format the drive.
TDLINE - puts a time/date line at top of screen.
note: CTHTDL is a replacement TDLINE that
is Y2K correct.
RDBASIC - make RAMDISK XL/XE.
RD - make ramdisk. SpDOS can probably use any RAMDISK
program you use.
CHVOL - change volume name of a disk. eg CHVOL D1:NEWNAME
CHTD - change time/date stamp of a file. eg. CHTD
FILE.EXT sets the t/d stamp to present t/d.
SCOPY - sector copy from one drive to another. Will
abort if there is a sector error. SCOPY isn't
used much, Disk Communicator is used instead
(DCOMM32.COM.)
eg. SCOPY D1: D2:
SCOPY D1: D2:FILENAME.SCP
SCOPY D2:FILENAME.SCP D3:
HDINIT and HDFMTPH - These are hard drive formatting
programs. SpDOS supports up
to 16 meg hard drives.
BATCH FILES:
A text file can be made to do any SpDOS commands or
run any external binary file. Just make the text
file with the correct syntax on each line.
STARTUP.BAT is searched for on the boot drive and
executed at boot time if found. You can run a batch
file from the command line by typing its name.
eg. KEY OFF
D1:RD.COM
COPY D3:*.* D8:
CTHTDL
CAR
Above will turn off the keyboard buffer, then establish
a RAMDISK, copy all files in the root directory of D3:
to D8:, turn on the CTHTDL time/date line, and run
the cartridge.

>Interesting piece of design work....

Definitely - except for the very cheap mechanical design and missing track-0
detector.

I don't have my schematics here, but
http://www.devili.iki.fi/Computers/Commodore/C1541/Service_Manual/Page_10.html
states:

UC2 is a VIA also. During a write operation the microprocessor passes the
data to be recorded to Port A of UC2. The data is then loaded into the PLA
parallel port (YB0-YB7). The PLA contains a shift register which converts
the parallel data into serial data. The PLA generates signals on pins 2, 3,
4, and 40 which control the write amplifier circuits on D-IN input on pin 24
of the PLA. The PLA shift register converts serial data into parallel data
that is latched at the parallel port (YB0-YB7). The register converts serial
data into parallel data that is latched at the parallel port (YB0-YB7). The
microprocessor reads the parallel data that is latched at the parallel port
(YB0-YB7). The microprocessor reads the parallel PLA output by reading Port
A of UC2 when BYTE READY on pin 39 goes "low."

I would guess that the 6502 would be too slow to bit-bang GCR-coded serial
data directly on a single VIA pin - and it would need the multiple rate on
reading to correctly recover the single bits, lacking an external PLL.

It seems there was an older version of the 1541 without the PLA, with
discrete logic instead - I never had one of these.

7544. Backing up 8-bit files from 1050 drive to a PC?

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-28 20:04:01 UTC
From: Mike Stepansky <design3d@2-scale.com>
Message-ID: <B8523A61.1B2A%design3d@2-scale.com>
Source record: 32218

To fellow Atarians,

My last visit to this Atari 8-bit newsgroup was back in March 7 2001.

I didn't have time to follow up with this guy who happen to live near Toledo, OH. I would like to order a special cable and software that allows me to connect a 1050 drive to a PC. Or maybe trade?

Question:

What is the best way to transfer all of the 8-bit games (or files) from 1050 floppy disks to Zip or CDR drive on a PC?

So that way, if something is lost on my 1050 floppy disk, I can always copy the file(s) from Zip or CDR disc back to the 1050 via serial cable.

I am just hoping that once I have them on CDR or Zip disk, then I can go always copy back to Atari floppy drive, in case of bad floppy disk.

Someone here in this atari newsgroup mentioned about a special software (?) specially made cable that can be hooked up from a PC serial port (?) to a 1050 drive port.

If you know a good atari 8-bit emulator for the PC, please share with your comments or solutions here.

Thanks,

Mike

Thats the problem I've heard of. luckily theres a couple of electronics surplus joints downtown (toronto near where I live) that typically have some. I also managed to locate 2 big boxes of the 5 1/4 inch disks in a garage sale a year and a half ago. At the rate I go through disks, they'll last me for most of this decade.

Roy G Biv wrote:

Mike,

Your best solution would be the 1050-to-PC interface and the program
Prosystem '98.

You can get info about APE (Atari Peripheral Emulator) and Prosystem '98 at:

http://www.atarimax.com/

And on this page you will find a link for the schematic for 1050-to-PC:

http://www.cswnet.com/~nkennedy/sio2pc.htm

Good luck with your archiving!

Glenn

I finally started converting all my Atari 8-bit disks (about 600 of em, both sides) to ATR/PRO format today. Obviously, this is going to take some time, but I'd like to see if anyone is interested in helping me out, mainly by testing the images and cataloging what is on them.

When finished, I'd like to know what each image contains, whether it works (and with which emulator/os/etc), and any emulator options that may need to be set.

Also, some of the stuff is copy-protected, thus requiring APE to use the .PRO images from a real atari if anyone wants to test that too..

If anyone is interested in helping, let me know!

-Frank Rachel

For the PC I would go with a SIO2PC cable and APE.

I can possibly help you out alittle. I use the ATR images and convert
them to DI images so I can them with my Atari Hades and a 130XE. You
may want to check the www and see if any of your disks are already in
ATR format. Do you have mostly games, if so you may want to go to the
URL address below and check out the mega ATR and DI images.

Alright! Go go go! Are you naming them DISK001.ATR, DISK002.ATR,
DISK003.ATR and so on?

I'm pretty much naming them like that. Most of the disks (80%) have numbers written on the label, so I'm naming them correspondingly (414_1.atr, 414_2.atr for disk 414 side 1 and 2, etc.).

I'm gonna set up a web site in the next couple of days with the images, and then some forms to input the data (contents, works?, tested w/which emulators, etc) so anyone who wants to help can. I'll post the details as soon as its ready..

7563. Wanted: original Quasimodo or Alley Cat, trade/cash offer! (disk versions)

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-30 06:20:56 UTC
From: Satcom2 <svenhard@mindspring.com>
Message-ID: <a0mcgn$1qh$1@slb6.atl.mindspring.net>
Source record: 32236

I am looking over my collection and it is almost complete. I have about every Atari 8-bit game that I ever liked playing, except for these two. I also have some incredibly rare shrinkwrapped new stuff in my collection, so I could make a trade perhaps.

Here's what I would offer for Alley Cat and Quasimodo, both boxed (disk versions only):

$100 cash for both OR

Trade for any 2 of the following Atari 800 xl xe games:

Crystal Castles cartridge game shrinkwrapped
Airball cartridge game shrinkwrapped
Mountain King cartridge shrinkwrapped
Telengard 1985 printing new shrinkwrapped
BC's Quest for Tires cartridge used good condition

I would settle for original disks with manuals also if you have no boxes, but offer $75 for both. Must be in working condition. E-mail me if you think you can make a deal with me, even if you only have one of these games. -Satcom2

7564. FSII cracked!

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-30 10:13:01 UTC
From: jerry_glenwright@hotmail.com
Message-ID: <2be33b6b.0112300213.2c9d7ef@posting.google.com>
Source record: 32237

Okay, here goes the flame invite!

For a long time I've been trying to figure out the copy protection built into Flight Simulator II (not every waking minute mind you -- I'm not that crazy, but you get the idea?). I *love* FSII and have bought many versions over the years for Atari 8bit, ST, Mac and PC as well as scenery.

Why did I want to crack the program? Three reasons: because I wanted to make working backups of my precious 8bit disks, because (and this is the most important reason) I wanted to use FSII with Atari800Win and other emulators and because I wanted to boot FSII from my 8bit hard drive.

The protected FSII allows only approximately 40 seconds of flight before blanking the screen and disabling the keyboard.

But now I've located the code that does the dirty work! Here's how to unprotect your FSII...

Make a backup copy with a sector copier (but ignoring bad sectors). Use a sector editor (I use Diskmaster) to locate sectors 206 and 207 and NOP (that is insert hex value 1A in place of) the following bytes: 78, A9, 00, 8D and 0E at the end of sector 206 and D4, 20, 82, 1B, 4C, 75 and 40 at the start of sector 207.

Write these sectors back to your copy disk. Now boot the game and enjoy as many hours as you like of flying! The method works equally well for disk images.

Please notice that I haven't posted a cracked copy of the program anywhere. All I'm doing is telling you how to break potection of your *own* copy (though I don't suppose Bruce Artwick and co. could care less whether we post 8bit versions of FSII or not! He'd probably just be happy that we still wanted to use it...)

I may write a little patch that locates the bytes and changes them automatically. If I do, I'll post it to the binaries group.

Happy flying!
Jerry

I can easily rename, but just curious, what DOS's wouldn't recognize the
"_". The ATR's are used by emulators, which typically exist for modern
OS's.. One of the platforms that the emulator is written for doesn't support
"_"'s?

I think more than one DOS has trouble with it, at least with respect
to file-names. Not so sure about disk-names. IIRC Bewe DOS will not
handle file-names with underline marks.

I don't have my actual Atari 800 here. Is there a way to type the
underline character on an actual Atari?

Are you referring to Atari DOS's? If so I don't think it matters because the images get loaded by the atari emulator (or by ape if you're going that route).

Good work and thank you, I allways wanted to run FS2 from my 8bit hard drive or even the MIO ramdisk.

Thanks

Kool, Stereo patch for World of Wonders demo, I need that.. wow demos sounds great in mono and would love to demo it in stereo. The Pokey Gumby stereo upgrade was blessed with easy to install docs, the Covox is another story and not the everydays Atari user can build one. Maybe someone can do a better doc for the Covox in fashion to the great docs from the Pokey Gumby upgrade. Oh lets not also forget that Zybex and Draconus was released with stereo patch a few years ago, I have them if you need them email me. I herd a member from Taquart did a SID upgrade but I never seen the docs to build one so if anyone has it please send it email.

Thanks

Ok its Hard to pick best Atari 8bit demo but here go's

1...Shake (APC)
2...The Top 1 (WFMH)
3...The Top 3 (WFMH)
4...Drunk Chessboard (FOX)
5...Sweet Illusions (Shadows)
6...Joyride (HARD)
7...Bobsland (Cobra)
8...Sheol (BB)
9...More! (BB)
10...Drunk Tank (QModos)
11...X-Demo (Madteam)
12...Trip6 (Shadows)
13...AssKicker (?)
14...Hale93 (abbuc)
15...ZERO (NG) awesome music!

All the above demo RULE on Little Atari in Music and Graphics fx.s. I cant wait to see what comming next from Madteam/Aids/Qmodos/BB and others. Its been awhile since anything new was releaded.

This is true, you can call your images ANYTHING you like, as long as the emulator in question supports it, and SIO2PC/APE can fall back to the 8.3 filename if need be.

As the emulator/OS is handling this, Atari DOS doesnt even know it's filename. Just that it's a Disk in a Drive :-)

I'm certainly looking forward to helping out...

Cheers

Aaron

Hey Guys, well 2002 is but 9 hours away (In New Zealand anyways!), Who would've thought back in the late 70's, early 80's that in 20 years, there would still be a strong following of Atari 8bitter's!! I'm glad to be one of them!

I always wonder what would've happened, had the IBM PC not taken off as well as it did. Maybe we would all have the Atari 2001 Equivalent on our desks at work. :-) (Obviously with Atari's marketing, this probably would'nt have happened even if the PC failed) :-(

Anyway, I have a request...Back in 1999 I think, Someone sent me a bunch of Disks named MBOOT001.ATR, MBOOT002.ATR etc (Sorry I've forgotten your name, and my mail archives are just that...archived!). But as there were so many of them, I only grabbed a few that had stuff i didnt have. Well, I would greatly appreciate if anyone still has these images (original person or not), if I could grab the rest of the ones remaining.

They are just Multiboot Menu ATR's with many games per disk.

If you have them, please drop me a line holmesatari@hotmail.com or atariNOSPAM@paradise.net.nz (remove NOSPAM), and I'll send a list of the ones I need. If you can help out with them all, I am very willing to help you out with any games/disks you need. And could send you a CDROM of 1000's of disk images if you need it.

Thanks in advanced.

Now Everyone have a Great New Years!! And go easy on the drinking!! ;-) We want you all back safely next year!

Regards

Aaron (aka.Holmes)
New Zealand

7580. Free Atari 8-bit HW in Seattle

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-31 04:09:59 UTC
From: megarat@yahoo.com
Message-ID: <6fa61d46.0112302009.7f91c121@posting.google.com>
Source record: 32253

Hi all,

Is there anyone in/around Seattle who's interested in some free Atari hardware?

A while back, I received up a motherlode of Atari 8-bit hardware from an enthusiast of old. I've picked out the bits and pieces I'm personally interested in keeping, which leaves me with about six cubic feet and maybe forty pounds of hardware left over.

I can't say there's anything really remarkable to be found, but there is: a (dusty) Atari 800 with all RAM/ROM cards, a cleaned-up Atari 850, a few power supplies, a pair of 410 program recorders, an old dot-matrix printer (C. Itoh Electronics, Model 8510A), a nifty vintage modem by Microbits Peripheral Products, lots of joystick, paddle, and keypad controllers, a numeric keypad ... and perhaps a few other things I can't recall right now. To my knowledge, everything works fine.

If you want it, it's yours. Come and pick it up, it's in a box, ready to go. Heck, if you live nearby (close to north Seattle), I might even be persuaded to deliver it. There's only one catch: please take everything; no cherry-picking, all or nothing. Ideally, I would like to see this stuff end up in a good home, but I guess I can't be choosy.

If you're interested, drop me a note at megarat at yahoo dot com.

(If I can't get any locals to take this off my hands, I might be willing to ship it elsewhere for the cost of shipping. That is, if there's a demand. I'm not sure how many people are actively interested in this cool old stuff anymore.)

Thanks,
cam

Find a nice list in your mail box :-)

7586. Need a list of Atari 8-bit emulators for PC (and Mac)

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-31 15:14:34 UTC
From: Mike Stepansky <design3d@2-scale.com>
Message-ID: <B855EB0A.1B49%design3d@2-scale.com>
Source record: 32258

Hi Atarians,

Does anyone of you know or have a LIST of good working 8-bit emulators for PC? Mac? Preferably using the standard Atari classic joysticks on PC and PowerPC Mac.

So far, as for as I know, one is called Gemulator but this is just an Atari ST emulator, right? The other is called Xformer2000, the only 8-bit I know of but I haven't tru it yet or where to download it. Maybe I am lacking the specs.

There are several other atari 8-bit emulators that I spotted in the www.download.com site. But I want to hear from you guys, with your good/bad experiences with your existings emulators. Be sure to post up the specs requirements to make it work.

To Steven Tucker <classics@atarimax.com>, a big thank you! This www.atarimax.com site may be what we am looking for! I will check it out and hope they do provide cables that I can order it from them.

Once I have the cable connected from 1050 drive to a PC, then I am half way there: to be able to run 8-bit on a PC, just for curiosity!

Thanks.

Mike

7587. Re: Backing up 8-bit files from 1050 drive to a PC?

Newsgroup: comp.sys.atari.8bit
Date: 2001-12-31 16:03:46 UTC
From: Mike Stepansky <design3d@2-scale.com>
Message-ID: <B855F692.1B4B%design3d@2-scale.com>
Source record: 32259

I am a bit confused:

What is the difference (or the function of) between the APE (Atari
Peripheral Emulator) and the Prosystem '98?

Which one is a cable stuff and which is a software and which is an emulator?
Does Prosystem have more features than the APE?

Does that mean APE is just an 8-bit emulator to run the Atari 8-bit software
on a PC? Or is APE is just an copy/backup utility to xfer to a PC? Does
that mean the APE needs/must have a Prosystem to operate correctly?

I only need to copy Atari games/files from 1050-to-PC. So which software is
it? APE or Prosystem?

The reason I am asking is because I see a "slash" (as in "APE/Prosystem")
from Steven Tucker's reply below lead me to believe that both are same
thing, right?

>> What is the best way to transfer all of the 8-bit games (or files) from 1050
>> floppy disks to Zip or CDR drive on a PC?

>> You can use a ProSystem interface and the ProSystem software to
>> do this. The APE/ProSystem package works under Windows 95/98/ME/2000/XP.

>> You can get the software and cable at the URL below.

>>http://www.atarimax.com/

I can't find a "cable" info in this site. Maybe I am missing something.

Confused Mike

Simple answer: Prosystem is used to CREATE the ATR/PRO images (from an atari disk drive hooked to PC), APE is used to USE the images (from a real Atari hooked to the PC).

APE is a program and cable that makes your PC act like disk
drives, the real Atari 'sees' the disk drives just like real disk drives.
Prosystem and cable is a different cable and software to allow
your pc to 'see' an Atari disk drive, you can't use Prosystem
(or similar 10502PC) as a disk drive for the Atari.
You need to decide which one you want.
APE (or sio2pc) is very useful for doing everything but
making PRO images of protected disks. Prosystem is limited
to making images, I think, never used it, it may also allow
transfer of files off a disk drive.
If you have a lot of original, copy protected disks, that you
want to make PRO images of, then you need Prosystem.
Otherwise, I'd suggest the APE software and cable.
There's another software and cable by Nick Kennedy called
sio2pc and 10502pc that do the same things, except make pro images.

Few more tests have to be done.

Try booting the computer with the drive powered up and the drive powered
off. If it makes the same noise in both cases, then it is probably a
RIOT/PIA type chip, 6532 IIRC.

If it makes a different noise in each case, it is probably the 12V power
supply. The 12V supply can be confirmed to be out by inserting disks in a
powered up drive. The activity light should go on when the door latch is
closed.

You may be able to just resolder the diodes on the back of the board between
the large capacitors. They break loose from thermal cycling.

And sometimes, one fails requiring replacement. Check resistance across individual diodes in both directions with a VOM. They should be high one way and low the opposite and all 4 about the same. I replaced my odd one with an IN 5400 from Radio Shack # 276-1141 and it is still ginning 18 months so far.

The CX40s are digital and require a hardware adapter to interface to a modern PC which uses a paddle like analog joystick; you might try dejanews.com archives of this group for a link to the construction details.

There is an XFormer ver. 3.8 for DOS which is the only one I have found to boot a DD image. Also for DOS are XL-it v.0.2 and Atari800 about v.1.05. Each is adequate for many uses, but many games are erratic as to which will handle them.

XFormer 2000 is for Win95 and up, as is Atari800Win v.3.0 just out in beta.

There was also a 'Rainbow' for both Mac and PC that I have never tried as I prefer the real 800 and an occasional XL.

No idea re MAC but simply THE best emulator is the Atari800 and the
ports thereof.

For windows it's Atari800win Plus

No other emu comes close now..

7597. WTB: Atari 800 w/ accesories

Folks, I am lookig for an Atari 800 computer in fairly good condition
if possible
with accesories such as joysticks,game catriges,floppy drives, etc.

If you have any information of one for sale or where I may find one
please e-mail
me at frodo64@houston.rr.com . Thank you!
